NOTE: Read the entire instruction manual before starting the installation.

NOTE: This furnace can be installed as a (2-pipe) direct vent or (1-pipe) non-direct vent condensing gas furnace.

Installation in Canada must conform to the requirements of CSA B149 code. Vent systems must be composed of pipe, fittings, cements, and primers listed to ULC S636. The special vent fittings and accessory concentric vent termination kits and accessory external drain trap have been certified to ULC S636 for use with those IPEX PVC vent components which have been certified to this standard. In Canada, the primer and cement must be of the same manufacturer as the vent system - IPEX System 636, PVC/CPVC Primer, Purple Violet for Flue Gas Venting and IPEX System 636, PVC Cement for Flue Gas Venting, rated Class IIA, 65 deg C. must be used with this venting system - do not mix primers and cements from one manufacturer with a vent system from a different manufacturer. Follow the manufacturer’s instructions in the use of primer and cement and never use primer or cement beyond its expiration date.

The safe operation, as defined by ULC S636, of the vent system is based on following these installation instructions, the vent system manufacturer’s installation instructions, and proper use of primer and cement. All fire stop and roof flashing used with this system must be UL listed material. Acceptability under Canadian standard CSA B149 is dependent upon full compliance with all installation instructions. Under this standard, it is recommended that the vent system be checked once a year by qualified service personnel.

The authority having jurisdiction (gas inspection authority, municipal building department, fire department, etc) should be consulted before installation to determine the need to obtain a permit.

Some Provinces may require the combustion air system to be ULC-S636 certified.
IMPORTANT

The Commonwealth of Massachusetts requires compliance with regulation 248 CMR as follows:

5.08: Modifications to NFPA-54, Chapter 10

2) Revise 10.8.3 by adding the following additional requirements:

a. For all side wall horizontally vented gas fueled equipment installed in every dwelling, building or structure used in whole or in part for residential purposes, including those owned or operated by the Commonwealth and where the side wall exhaust vent termination is less than seven (7) feet (2.1 M) above finished grade in the area of the venting, including but not limited to decks and porches, the following requirements shall be satisfied:

1. INSTALLATION OF CARBON MONOXIDE DETECTORS. At the time of installation of the side wall horizontal vented gas fueled equipment, the installing plumber or gasfitter shall observe that a hard wired carbon monoxide detector with an alarm and battery back-up is installed on the floor level where the gas equipment is to be installed. In addition, the installing plumber or gasfitter shall observe that a battery operated or hard wired carbon monoxide detector with an alarm is installed on each additional level of the dwelling, building or structure served by the side wall horizontal vented gas fueled equipment. It shall be the responsibility of the property owner to secure the services of qualified licensed professionals for the installation of hard wired carbon monoxide detectors.

   a. In the event that the side wall horizontally vented gas fueled equipment is installed in a crawl space or an attic, the hard wired carbon monoxide detector with alarm and battery back-up may be installed on the next adjacent floor level.

   b. In the event that the requirements of this subdivision can not be met at the time of completion of installation, the owner shall have a period of thirty (30) days to comply with the above requirements; provided, however, that during said thirty (30) day period, a battery operated carbon monoxide detector with an alarm shall be installed.

2. APPROVED CARBON MONOXIDE DETECTORS. Each carbon monoxide detector as required in accordance with the above provisions shall comply with NFPA 720 and be ANSI/UL 2034 listed and IAS certified.

3. SIGNAGE. A metal or plastic identification plate shall be permanently mounted to the exterior of the building at a minimum height of eight (8) feet above grade directly in line with the exhaust vent terminal for the horizontally vented gas fueled heating appliance or equipment. The sign shall read, in print size no less than one-half (1/2) inch in size, "GAS VENT DIRECTLY BELOW. KEEP CLEAR OF ALL OBSTRUCTIONS".

4. INSPECTION. The state or local gas inspector of the side wall horizontally vented gas fueled equipment shall not approve the installation unless, upon inspection, the inspector observes carbon monoxide detectors and signage installed in accordance with the provisions of 248 CMR 5.08(2)(a)1 through 4.

5. EXEMPTIONS: The following equipment is exempt from 248 CMR 5.08(2)(a)1 through 4:

   (1.) The equipment listed in Chapter 10 entitled "Equipment Not Required To Be Vented" in the most current edition of NFPA 54 as adopted by the Board; and

   (2.) Product Approved side wall horizontally vented gas fueled equipment installed in a room or structure separate from the dwelling, building or structure used in whole or in part for residential purposes.

   c. MANUFACTURER REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM PROVIDED. When the manufacturer of Product Approved side wall horizontally vented gas equipment provides a venting system design or venting system components with the equipment, the instructions provided by the manufacturer for installation of the equipment and the venting system shall include:

      1. Detailed instructions for the installation of the venting system design or the venting system components; and

      2. A complete parts list for the venting system design or venting system.

   d. MANUFACTURER REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM NOT PROVIDED. When the manufacturer of a Product Approved side wall horizontally vented gas fueled equipment does not provide the parts for venting the flue gases, but identifies “special venting systems”, the following requirements shall be satisfied by the manufacturer:

      1. The referenced “special venting system” instructions shall be included with the appliance or equipment installation instructions; and

      2. The “special venting systems” shall be Product Approved by the Board, and the instructions for that system shall include a parts list and detailed installation instructions.

   e. A copy of all installation instructions for all Product Approved side wall horizontally vented gas fueled equipment, all venting instructions, all parts lists for venting instructions, and/or all venting design instructions shall remain with the appliance or equipment at the completion of the installation.

For questions regarding these requirements, please contact the Commonwealth of Massachusetts Board of State Examiners of Plumbers and Gas Fitters, 239 Causeway Street, Boston, MA 02114. 617-727-9952.

# SAFETY CONSIDERATIONS

- **CAUTION**

  **FURNACE RELIABILITY HAZARD**

  Failure to follow this caution may result in unit component damage.

  Application of this furnace should be indoors with special attention given to vent sizing and material, gas input rate, air temperature rise, unit leveling, and unit sizing.

- **WARNING**

  **FIRE, EXPLOSION, ELECTRICAL SHOCK AND CARBON MONOXIDE POISONING HAZARD**

  Failure to follow this warning could result in personal injury, death, or property damage.

  Improper installation, adjustment, alteration, service, maintenance, or use can cause carbon monoxide poisoning, explosion, fire, electrical shock, or other conditions which may cause personal injury or property damage. Consult a qualified installer, service agency, local gas supplier, or your distributor or branch for information or assistance. The qualified installer or agency must use only factory-authorized and listed kits or accessories when modifying this product.

  Installing and servicing heating equipment can be hazardous due to gas and electrical components. **Only trained and qualified personnel should install, repair, or service heating equipment.** Untrained personnel can perform basic maintenance functions such as cleaning and replacing air filters. All other operations must be performed by trained service personnel. When working on heating equipment, observe precautions in literature, on tags, and on labels attached to or shipped with unit and other safety precautions that may apply.

  These instructions cover the minimum requirements and conform to existing national standards and safety codes. In some instances, these instructions exceed certain local codes and ordinances, especially those that may not have kept up with changing residential construction practices. We require these instructions as a minimum for a safe installation.

  Wear safety glasses and work gloves.

  **CAUTION**

  **CUT HAZARD**

  Failure to follow this caution may result in personal injury.

  Sheet metal parts may have sharp edges or burrs. Use care and wear appropriate protective clothing and gloves when handling parts.

  Follow all safety codes. Wear safety glasses, protective clothing, and work gloves. Have a fire extinguisher available. Read these instructions thoroughly and follow all warnings or cautions included in literature and attached to the unit. Consult local building codes, the current editions of the National Fuel Gas Code (NFHC) NFPA 54/ANSI Z223.1 and the National Electrical Code (NEC) NFPA 70.

  In Canada, refer to the current editions of the National Standards of Canada CAN/CSA–B149.1 and .2 Natural Gas and Propane Installation Codes, and Canadian Electrical Code CSA C22.1.

  Recognize safety information. This is the safety-alert symbol. When you see this symbol on the unit and in instructions or manuals, be alert to the potential for personal injury.

  Understand these signal words: DANGER, WARNING, and CAUTION. These words are used with the safety-alert symbol. DANGER identifies the most serious hazards which will result in severe personal injury or death. WARNING signifies hazards which could result in personal injury or death. CAUTION is used to identify unsafe practices which may result in minor personal injury or product and property damage. NOTE is used to
highlight suggestions which **will** result in enhanced installation, reliability, or operation.

![Diagram of Airflow Directions](image)

**Fig. 1 - Mulipoise Orientations**

The model 58MEC, 2-Stage, 4-way Mulipoise, Gas-Fired, Category IV, condensing furnace is available in model sizes ranging in high-stage gas input rates of 60,000 to 120,000 Btu/h. This furnace is CSA (formerly AGA and CGA) design-certified for natural and propane gases (see furnace rating plate) and for installation in alcones, attics, basements, closets, utility rooms, crawlspaces, and garages. This furnace is factory-shipped for use with natural gas. A CSA listed gas conversion kit is required to convert furnace for use with propane gas.

See Fig. 3 for required clearances to combustibles.

This furnace **SHALL NOT** be installed directly on carpeting, tile, or any other combustible material other than wood flooring. For downflow installations, a factory accessory floor base must be used when installed on combustible materials and wood flooring. Special base is not required when this furnace is installed on the manufacturer’s coil assembly or when the manufacturer’s coil box is used. The design of the 58MEC furnace is not CSA certified for installation in mobile homes, recreational vehicles, or outdoors. This furnace is suitable for installation in a structure built on site or a manufactured building completed at final site.

This furnace is designed for continuous return-air minimum temperature of 60°F (15°C) db or intermittent operation down to 55°F (13°C) db such as when used with a night setback thermostat. Return-air temperature must not exceed 80°F (27°C) db. Failure to follow these return air limits may affect reliability of heat exchangers, motors and controls. (See Fig. 4.)

This furnace is shipped with the drain and pressure tubes connected for **UPFLOW** applications. Minor modifications are required when used in **DOWNFLOW, HORIZONTAL RIGHT,** or **HORIZONTAL LEFT** (supply-air discharge direction) applications as shown in Fig. 1. See details in Applications section.

Install this furnace only in a location and position as specified in LOCATION and INSTALLATION sections of these instructions.

Always provide adequate combustion and ventilation air as specified in section Combustion Air and Vent Pipe Systems of these instructions to furnace.

Combustion products must be discharged outdoors. Connect this furnace to an approved vent system only, as specified in the Combustion Air and Vent Piping sections of these instructions.

Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections, as specified in the GAS PIPING section of these instructions.

Always install furnace to operate within the furnace’s intended range with a duct system which has an external static pressure within the allowable range, as specified in the SET TEMPERATURE RISE section of these instructions and furnace rating plate.

When a furnace is installed so that supply ducts carry air circulated by the furnace to areas outside the space containing the furnace, the return air shall also be handled by duct(s) sealed to the furnace casing and terminating outside the space containing the furnace.

A gas-fired furnace for installation in a residential garage must be installed as specified in the Hazardous Locations section of these instructions.

The furnace may be used for construction heat provided that the furnace installation and operation complies with:

- The furnace is permanently installed with all electrical wiring, piping, air filters, venting and ducting installed according to these installation instructions. A return air duct is provided, sealed to the furnace casing, and terminated outside the space containing the furnace. This prevents a negative pressure condition as created by the circulating air blower, causing a flame rollout and/or drawing combustion products into the structure.
- The furnace is controlled by a thermostat. It may not be “hot wired” to provide heat continuously to the structure without thermostatic control.
- Clean outside air is provided for combustion. This is to minimize the corrosive effects of adhesives, sealers and other construction materials. It also prevents the entrainment of drywall dust into combustion air, which can cause fouling and plugging of furnace components.
- The temperature of the return air to the furnace is maintained between 55°F (13°C) and 80°F (27°C), with no evening setback or shutdown. The use of the furnace while the structure is under construction is deemed to be intermittent operation per our installation instructions.
- The air temperature rise is within the rated rise range on the furnace rating plate, and the firing rate has been set to the nameplate value.
- The filters used to clean the circulating air during the construction process must be either changed or thoroughly cleaned prior to occupancy.
- The furnace, ductwork and filters are cleaned as necessary to remove drywall dust and construction debris from all HVAC system components after construction is completed.

This furnace is shipped with the following materials to assist in proper furnace installation. These materials are shipped in the main blower compartment.

The furnace shall be installed so that the electrical components are protected from water.

For accessory installation detail, refer to the accessory installation instruction.
NOTE: Remove all shipping materials before operating furnace.

**CODES AND STANDARDS**

Follow all national and local codes and standards in addition to these instructions. The installation must comply with regulations of the serving gas supplier, local building, heating, plumbing, and other codes. In absence of local codes, the installation must comply with the national codes listed below and all authorities having jurisdiction.

In the United States and Canada, follow all codes and standards for the following:

**Step 1 - Safety**
- CANADA: National Standard of Canada, Natural Gas and Propane Installation Code (NSCNGPIC) CSA B149.1-05

**Step 2 - General Installation**
- US: NFGC and the NFPA 90B. For copies, contact the National Fire Protection Association Inc., Batterymarch Park, Quincy, MA 02269; or for only the NFGC contact the American Gas Association, 400 N. Capitol, N.W., Washington DC 20001
- CANADA: NSCNGPIC. For a copy, contact Standard Sales, CSA International, 178 Rexdale Boulevard, Etobicoke (Toronto), Ontario, M9W 1R3, Canada.

**Step 3 - Combustion and Ventilation Air**
- US: Section 9.3 of the NFGC, Air for Combustion and Ventilation
- CANADA: Part 8 of the NSCNGPIC, Venting Systems and Air Supply for Appliances

**Step 4 - Duct Systems**

**Step 5 - Acoustical Lining and Fibrous Glass Duct**
- US and CANADA: current edition of SMACNA, NFPA 90B as tested by UL Standard 181 for Class I Rigid Air Ducts

**Step 6 - Gas Piping and Gas Pipe Pressure Testing**
- US: Section 9.3 NFPA 54/ANSI Z223.1-2009 NFGC; Chapters 5, 6, 7, and 8 and national plumbing codes.
- CANADA: CAN/CSA-B149.1-05, Parts 4, 5, 6, and 9.

In the state of Massachusetts:
- This product must be installed by a licensed plumber or gas fitter.
- When flexible connectors are used, the maximum length shall not exceed 36 in. (914 mm).
- When lever type gas shutoffs are used they shall be T-handle type.
- The use of copper tubing for gas piping is not approved by the state of Massachusetts.

**Step 7 - Electrical Connections**
- CANADA: Canadian Electrical Code CSA C22.1

![Fig. 2 - Return-Air Temperature](A05004)
NOTES:

1. Minimum return-air openings at furnace, based on metal duct. If flex duct is used, see flex duct manufacturer's recommendations for equivalent diameters.

2. Minimum return-air opening at furnace:
   a. For 500 CFM (12-in. (305mm) round or 14 1/2-in. (368mm) x 12-in. (305mm) rectangle).
   b. For 1000 CFM (20-in. (508mm) round or 14 1/2-in. (368mm) x 19 1/2-in. (495mm) rectangle).
   c. For 1600 CFM (22-in. (559mm) round or 14 1/2-in. (368mm) x 23 3/4-in. (602mm) rectangle).
   d. For airflow requirements above 1000 CFM, see Air Delivery table in Product Data for specific use of single side inlets. The use of both side inlets, a combination of 1 side and the bottom, or the bottom only will ensure adequate return air openings for airflow requirements above 1600 CFM at 0.5% W.C. ESP.

Electrostatic Discharge (ESD) Precautions Procedure

**CAUTION**

**UNIT DAMAGE HAZARD**

Failure to follow this caution may result in damage to unit components.

Electrostatic discharge can affect electronic components. Take precautions during furnace installation and servicing to protect the furnace electronic control. Precautions will prevent electrostatic discharges from personnel and hand tools which are handled during the procedure. These precautions will help to avoid exposing the control to electrostatic discharge by putting the furnace, the control, and the person at the same electrostatic potential.

3. Disconnect all power to the furnace. Multiple disconnects may be required. DO NOT TOUCH THE CONTROL OR ANY WIRE CONNECTED TO THE CONTROL PRIOR TO DISCHARGING YOUR BODY'S ELECTROSTATIC CHARGE TO GROUND.

4. Firmly touch the clean, unpainted, metal surface of the furnace chassis which is close to the control. Tools held in hand during grounding will be discharged.

5. After touching the chassis, you may proceed to service the control, or connecting wires as long as you do nothing to recharge your body (moving or shuffling feet, touching ungrounded objects, etc.).

6. If you touch ungrounded objects, firmly touch a clean, unpainted metal surface of the furnace again before touching control or wires.

7. Use this procedure for installed and uninstalled (ungrounded) furnaces.

8. Before removing a new control from its container, discharge your body’s electrostatic charge to ground to protect the control from damage. If the control is to be installed in a furnace, follow items 1 through 4 before bringing the control or yourself in contact with the furnace. Put all used and new controls into containers before touching ungrounded objects.

9. An ESD service kit (available from commercial sources) may also be used to prevent ESD damage.
INTRODUCTION
The model 58MEC 4-way multipoise, Gas-Fired, Category IV, condensing furnace is available in model sizes ranging from input capacity of 60,000 to 120,000 Btuh as a direct vent (2-pipe) application as well as a non-direct vent (1-pipe) application.

APPLICATIONS

⚠️ CAUTION

PROPERTY DAMAGE
Failure to follow this caution may result in property damage.
Local codes may require a drain pan under entire furnace and condensate trap when a condensing furnace is used in an attic application or over a finished ceiling.

Step 1 - General
Some assembly and modifications are required for furnaces installed in any of the 4 applications shown in Fig. 1. All drain and pressure tubes are connected as shown in Fig. 6. See appropriate application instructions for these procedures.

Step 2 - Upflow Applications
In an upflow application, the blower is located below the burner section, and conditioned air is discharged upwards.

CONDENSATE TRAP LOCATION
(FACTORY-SHIPPED ORIENTATION)
The condensate trap is factory installed in the blower shelf and factory connected for UPFLOW applications. A factory-supplied tube is used to extend the condensate trap drain connection to the desired furnace side for field drain attachment. See Condensate Trap Tubing (Factory-Shipped Orientation) section for drain tube extension details. (See Fig. 5.)

CONDENSATE TRAP TUBING
(FACTORY-SHIPPED ORIENTATION)

NOTE: See Fig. 6 or tube routing label on main furnace door to confirm location of these tubes.

1. Collector Box Drain, Inducer Housing Drain, Relief Port, and Pressure Switch Tubes
   These tubes should be factory attached to condensate trap and pressure switch ready for use in upflow applications. These tubes can be identified by their connection location and also by a color label on each tube. These tubes are identified as follows: collector box drain tube (blue label), inducer housing drain tube (violet label or molded), relief port tube (green label), and pressure switch tube (pink label).

2. Condensate Trap Drain Tube
   The condensate trap drain connection must be extended for field attachment by doing the following:
   f. Determine location of field drain connection. (See Fig. 2 or 6)
   NOTE: If internal filter or side Filter/Media Cabinet is used, drain tube should be located to opposite side of casing from return duct attachment to assist in filter removal.
   g. Remove and discard casing drain hole plug button from desired side.
   h. Install drain tube coupling grommet (factory-supplied in loose parts bag) in selected casing hole.
   i. Slide drain tube coupling (factory-supplied in loose parts bag) through grommet ensuring long end of coupling faces blower.
   j. Cement 2 factory-supplied 1/2-in. street CPVC elbows to the rigid drain tube connection on the condensate trap. (See Fig. 6.) These elbows must be cemented together and cemented to condensate trap drain connection.
NOTE: Failure to use CPVC elbows may allow drain to kink and prevent draining.

k. Connect larger diameter drain tube and clamp (factory supplied in loose parts bag) to condensate trap and clamp securely.

l. Route tube to coupling and cut to appropriate length.

m. Attach tube to coupling and clamp securely.

**CONDENSATE TRAP LOCATION (ALTERNATE UPFLOW ORIENTATION)**

An alternate location for the condensate trap is the left-hand side of casing. (See Fig. 2 and 7.)

NOTE: If the alternate left-hand side of casing location is used, the factory-connected drain and relief port tubes must be disconnected and modified for attachment. See Condensate Trap Tubing (Alternate Upflow Orientation) section for tubing attachment. To relocate condensate trap to the left hand side, perform the following:

1. Remove 3 tubes connected to condensate trap.
2. Remove trap from blower shelf by gently pushing tabs inward and rotating trap.
3. Install casing hole filler cap (factory-supplied in loose parts bag) into blower shelf hole where trap was removed.

---

**WARNING**

**CARBON MONOXIDE POISONING HAZARD**

Failure to follow this warning could result in personal injury or death.

Casing hole filler cap must be installed in blower shelf hole when condensate trap is relocated to prevent combustion products being drawn in from appliances in the equipment room.

4. Install condensate trap into left-hand side casing hole by inserting tube connection stubs through casing hole and rotating until tabs snap into locking position.
5. Fill unused condensate trap casing holes with plastic filler caps (factory-supplied in loose parts bag).

---

**CONDENSATE TRAP TUBING (ALTERNATE UPFLOW ORIENTATION)**

NOTE: See Fig. 7 or tube routing label on main furnace door to confirm location of these tubes.

1. Collector Box Drain
   Tube Connect collector box drain tube (blue label) to condensate trap.

NOTE: On 17-1/2 in. (445 mm) wide furnaces ONLY, cut tube between corrugated sections to prevent kinks from occurring.
2. Inducer Housing Drain Tube
   a. Remove and discard LOWER (molded) inducer housing drain tube which was previously connected to condensate trap.
   b. Use inducer housing drain extension tube (violet label and factory-supplied in loose parts bag) to connect LOWER inducer housing drain connection to the condensate trap.
   c. Determine appropriate length, cut, and connect tube.
   d. Clamp tube to prevent any condensate leakage.

3. Relief Port Tube
   a. Connect relief port tube (green label) to condensate trap.
   b. Extend this tube (if required) by splicing to small diameter tube (factory-supplied in loose parts bag).
   c. Determine appropriate length, cut, and connect tube.

CONDENSATE TRAP FIELD DRAIN ATTACHMENT
Refer to Condensate Drain section for recommendations and procedures.

PRESSURE SWITCH TUBING
The LOWER collector box pressure tube (pink label) is factory connected to the High Pressure Switch and should not require any modification.

NOTE: See Fig. 6 or 7 or tube routing label on main furnace door to check for proper connections.

UPPER COLLECTOR BOX AND INDUCER HOUSING (UNUSED) DRAIN CONNECTIONS

Upper Collector Box Drain Connection
Attached to the UPPER collector box drain connection is a factory-installed corrugated, plugged tube (blue and white striped label). This tube is plugged to prevent condensate leakage in this application. Ensure this tube is plugged.

NOTE: See Fig. 6 or 7 or tube routing label on main furnace door to check for proper connections.

Upper Inducer Housing Drain Connection
Attached to the UPPER (unused) inducer housing drain connection is a cap and clamp. This cap is used to prevent condensate leakage in this application. Ensure this connection is capped.

NOTE: See Fig. 6 or 7 or tube routing label on main furnace door to check for proper connections.

CONDENSATE TRAP FREEZE PROTECTION
Refer to Condensate Drain Protection section for recommendations and procedures.

Step 3 - Downflow Applications
In a downflow furnace application, the blower is located above the burner section, and conditioned air is discharged downwards.

CONDENSATE TRAP LOCATION
The condensate trap must be removed from the factory-installed blower shelf location and relocated in selected application location as shown in Fig. 2, 8 or 9.
To relocate condensate trap from the blower shelf to desired location, perform the following:

1. Remove 3 tubes connected to condensate trap.
2. Remove trap from blower shelf by gently pushing tabs inward and rotating trap.
3. Remove casing hole filler cap from casing hole. (See Fig. 2, 8 or 9.)
4. Install casing hole filler cap into blower shelf hole where trap was removed.
5. Install condensate trap into desired casing hole by inserting tube connection stubs through casing hole and rotating until tabs snap into locking position.

**WARNING**

**CARBON MONOXIDE POISONING HAZARD**

Failure to follow this warning could result in personal injury or death.

Casing hole filler cap must be installed in blower shelf hole when condensate trap is relocated to prevent combustion products being drawn in from appliances in the equipment room.

5. Install condensate trap into desired casing hole by inserting tube connection stubs through casing hole and rotating until tabs snap into locking position.

**CONDENSATE TRAP TUBING**

**NOTE:** See Fig. 8 or 9 or tube routing label on main furnace door to check for proper connections.

Relocate tubes as described below.

1. Collector Box Drain Tube
   a. Remove factory-installed plug from LOWER collector box drain tube (blue and white striped label).
2. Inducer Housing Drain Tube
   a. Remove factory-installed cap and clamp from LOWER inducer housing drain connection.
b. Remove and discard UPPER (molded) inducer housing drain tube which was previously connected to condensate trap.
c. Install cap and clamp on UPPER inducer housing drain connection where molded drain tube was removed.
d. Use inducer housing drain tube (violet label and factory-supplied in loose parts bag) to connect LOWER inducer housing drain connection to the condensate trap.
e. Connect inducer housing drain connection to condensate trap.

(1.) Condensate Trap Located on Left Side of Casing
a. Determine appropriate length and cut.
b. Connect tube to condensate trap.
c. Clamp tube to prevent any condensate leakage.

(2.) Condensate Trap Located on Right Side of Casing
a. Route inducer housing drain tube (violet label) directly from inducer housing to condensate trap as shown in Fig. 9.
b. Determine appropriate length and cut.
c. Connect tube to condensate trap.
d. Clamp tube to prevent any condensate leakage.

3. Relief Port Tube Refer to Pressure Switch Tubing section for connection procedure.

**CONDENSATE TRAP FIELD DRAIN ATTACHMENT**

Refer to Condensate Drain section for recommendations and procedures.

**PRESSURE SWITCH TUBING**

One collector box pressure tube (pink label) is factory connected to the High Pressure Switch for use when furnace is installed in upflow applications. This tube MUST be disconnected and used for the condensate trap relief port connection. The other collector box pressure tube (green label) which was factory connected to the condensate trap relief port connection MUST be connected to the High Pressure Switch in DOWNFLOW or HORIZONTAL RIGHT applications.

**NOTE:** See Fig. 8 or 9 or tube routing label on main furnace door to check for proper connections.

1. Disconnect collector box pressure tube (pink label) attached to High Pressure Switch.
2. Extend collector box pressure tube (green label) which was previously connected to condensate trap relief port connection by splicing to small diameter tube (factory-supplied in loose parts bag).
3. Connect collector box pressure tube (green label) to High Pressure Switch connection labeled COLLECTOR BOX.
4. Extend collector box pressure tube (pink label) which was previously connected to High Pressure Switch by splicing to remaining small diameter tube (factory-supplied in loose parts bag).
5. Route this extended tube (pink label) to condensate trap relief port connection.
6. Determine appropriate length, cut, and connect tube.
7. Clamp tube to relief port connection.

**CONDENSATE TRAP FREEZE PROTECTION**

Refer to Condensate Drain Protection section for recommendations and procedures.

---

**Step 4 - Horizontal Left (Supply-Air Discharge) Applications**

In a horizontal left furnace application, the blower is located to the right of the burner section, and conditioned air is discharged to the left.

**CONDENSATE TRAP LOCATION**

The condensate trap must be removed from the factory-installed blower shelf location and relocated in selected application location as shown in Fig. 2 or 10.

To relocate condensate trap from the blower shelf to desired location, perform the following:

1. Remove 3 tubes connected to condensate trap.
2. Remove trap from blower shelf by gently pushing tabs inward and rotating trap.
3. Install casing hole filler cap (factory-supplied in loose parts bag) into blower shelf hole where trap was removed.

**WARNING**

**CARBON MONOXIDE POISONING HAZARD**

Failure to follow this warning could result in personal injury or death.

Casing hole filler cap must be installed in blower shelf hole when condensate trap is relocated to prevent combustion products being drawn in from appliances in the equipment room.

4. Install condensate trap into left-hand side casing hole by inserting tube connection stubs through casing hole and rotating until tabs snap into locking position.
5. Fill unused condensate trap casing holes with plastic filler caps (factory-supplied in loose parts bag).

**CONDENSATE TRAP TUBING**

**NOTE:** See Fig. 10 or tube routing label on main furnace door to check for proper connections.

1. Collector Box Drain Tube
   a. Install drain tube coupling (factory-supplied in loose parts bag) into collector box drain tube (blue label) which was previously connected to condensate trap.
   b. Connect large diameter drain tube and clamp (factory-supplied in loose parts bag) to drain tube coupling, extending collector box drain tube.
   c. Route extended tube (blue label) to condensate trap and cut to appropriate length.
   d. Clamp tube to prevent any condensate leakage.
2. Inducer Housing Drain Tube
   a. Remove and discard LOWER (molded) inducer housing drain tube which was previously connected to condensate trap.
   b. Use inducer housing drain extension tube (violet label and factory-supplied in loose parts bag) to connect LOWER inducer housing drain connection to the condensate trap.
   c. Determine appropriate length, cut, and connect tube.
   d. Clamp tube to prevent any condensate leakage.
3. Relief Port Tube
   a. Extend collector box tube (green label) which was previously connected to the condensate trap by splicing to small diameter tube (factory-supplied in loose parts bag).
   b. Route extended collector box pressure tube to relief port connection on the condensate trap.
   c. Determine appropriate length, cut, and connect tube.
   d. Clamp tube to prevent any condensate leakage.

CONDENSATE TRAP FIELD DRAIN ATTACHMENTS
Refer to Condensate Drain section for recommendations and procedures.

PRESSURE SWITCH TUBING
The LOWER collector box pressure tube (pink label) is factory connected to the High Pressure Switch for use when furnace is installed in UPFLOW applications. This tube MUST be disconnected, extended, rerouted, and then reconnected to the pressure switch in HORIZONTAL LEFT applications for 060 and 080 heating input furnaces.

NOTE: See Fig. 10 or tube routing label on main furnace door to check for proper connections.
Modify tube as described below:
   1. Disconnect collector box pressure tube (pink label) attached to High Pressure Switch.
   2. Use smaller diameter tube (factory-supplied in loose parts bag) to extend tube disconnected in item 1.
   3. Route extended tube:
      a. Behind inducer housing.
      b. Between blower shelf and inducer housing.

4. Determine appropriate length, cut, and reconnect tube to High Pressure Switch connection labeled COLLECTOR BOX.

CONDENSATE TRAP FREEZE PROTECTION
Refer to Condensate Drain Protection section for recommendations and procedures.

CONSTRUCT A WORKING PLATFORM
Construct working platform where all required furnace clearances are met. (See Fig. 3 and 11 or 12.)

UNIT OPERATION HAZARD
Failure to follow this caution may result in intermittent unit operation.
The condensate trap MUST be installed below furnace. See Fig. 5 for dimensions. The drain connection to condensate trap must also be properly sloped to an open drain.

NOTE: Combustion-air and vent pipes are restricted to a minimum length of 5 ft (1.5 M). (See Table 14.)

NOTE: A 12-in. (305 mm) minimum offset pipe section is recommended with short (5 to 8 ft (1.5 to 2.4 M)) vent systems. This recommendation is to reduce excessive condensate droplets from exiting the vent pipe. (See Fig. 11, 12 or 43.)

Step 5 - Horizontal Right (Supply-Air Discharge) Applications
In a horizontal right furnace application, the blower is located to the left of the burner section, and conditioned air is discharged to the right.
**COMBUSTION - AIR INTAKE VENT**

**MANUAL SHUTOFF GAS VALVE**

**SEDIMENT TRAP CONDENSATE TRAP**

**DRAIN ACCESS OPENING FOR TRAP**

**NOTE:** LOCAL CODES MAY REQUIRE A DRAIN PAN UNDER THE FURNACE AND CONDENSATE TRAP WHEN A CONDENSING FURNACE IS INSTALLED ABOVE FINISHED CEILINGS.

---

**PROPERTY DAMAGE**

Failure to follow this caution may result in property damage.

Local codes may require a drain pan under entire furnace and condensate trap when a condensing furnace is used in an attic application or over a finished ceiling.

**CAUTION**

**NOTE:** The auxiliary junction box (J-Box) MUST be relocated to opposite side of furnace casing. (See Fig. 13.) See Electrical Connection section for J-Box relocation.

**CONDENSATE TRAP LOCATION**

The condensate trap must be removed from the factory-installed blower shelf location and relocated in selected application location as shown in Fig. 2 or 13.

To relocate condensate trap from the blower shelf to desired location, perform the following:

1. Remove 3 tubes connected to condensate trap.
2. Remove trap from blower shelf by gently pushing tabs inward and rotating trap.
3. Install casing hole filler cap (factory-supplied in loose parts bag) into blower shelf hole where trap was removed.

---

**WARNING**

**CARBON MONOXIDE POISONING HAZARD**

Failure to follow this warning could result in personal injury or death.

Casing hole filler cap must be installed in blower shelf hole when condensate trap is relocated to prevent combustion products being drawn in from appliances in the equipment room.

4. Install condensate trap into right-hand side casing hole by inserting tube connection stubs through casing hole and rotating until tabs snap into locking position.
5. Fill unused condensate trap casing holes with plastic filler caps (factory-supplied in loose parts bag).

**CONDENSATE TRAP TUBING**

**NOTE:** See Fig. 13 or tube routing label on main furnace door to check for proper connections.

1. Collector Box Drain Tube:
   a. Remove factory-installed plug from LOWER collector box drain tube (blue and white striped label).
   b. Install removed clamp and plug into UPPER collector box drain tube (blue label) which was previously connected to condensate trap.
   c. Connect LOWER collector box drain tube (blue and white striped label) to condensate trap. Tube does not need to be cut.
   d. Clamp tube to prevent any condensate leakage.
2. Inducer Housing Drain Tube:
   a. Remove factory-installed cap and clamp from LOWER inducer housing drain connection.
   b. Remove and discard UPPER (molded) inducer housing drain tube which was previously connected to condensate trap.
   c. Install cap and clamp on UPPER inducer housing drain connection where molded drain tube was removed.
   d. Use inducer housing drain extension tube (violet label and factory-supplied in loose parts bag) to connect LOWER inducer housing drain connection to condensate trap.
   e. Determine appropriate length, cut, and connect tube to condensate trap.
   f. Clamp tube to prevent any condensate leakage.

3. Relief Port Tube:
   Refer to Pressure Switch Tubing section for connection procedure.

**CONDENSATE TRAP FIELD DRAIN ATTACHMENT**
Refer to Condensate Drain section for recommendations and procedures.

**PRESSURE SWITCH TUBING**
One collector box pressure tube (pink label) is factory connected to the High Pressure Switch for use when furnace is installed in UPFLOW applications. This tube MUST be disconnected and used for the condensate trap relief port tube. The other collector box pressure tube (green label) which was factory connected to the condensate trap relief port connection MUST be connected to the High Pressure Switch in DOWNFLOW or HORIZONTAL RIGHT applications.

**NOTE:** See Fig. 12 or tube routing label on main furnace door to check for proper connections.

Relocate tubes as described below.

1. Disconnect collector box pressure tube (pink label) attached to High Pressure Switch.
2. Extend collector box pressure tube (green label) which was previously connected to condensate trap relief port connection by splicing to small diameter tube (factory-supplied in loose parts bag).
3. Connect collector box pressure tube (green label) to High Pressure Switch connection labeled COLLECTOR BOX.
4. Use remaining smaller diameter tube (factory-supplied in loose parts bag) to extend collector box pressure tube (pink label) which was previously connected to High Pressure Switch. Route this extended tube (pink label) to condensate trap relief port connection.
5. Determine appropriate length, cut, and connect tube.
6. Clamp tube to relief port connection.

**CONDENSATE TRAP FREEZE PROTECTION**
Refer to Condensate Drain Protection section for recommendations and procedures.

**CONSTRUCT A WORKING PLATFORM**
Construct working platform where all required furnace clearances are met. (See Fig. 3 and 11 or 12.)
UNIT OPERATION HAZARD
Failure to follow this caution may result in intermittent unit operation.
The condensate trap MUST be installed below furnace. See Fig. 5 for dimensions. The drain connection to condensate trap must also be properly sloped to an open drain.

NOTE: Combustion-air pipe (when applicable) and vent pipe(s) are restricted to a minimum length of 5 ft (1.5 M). (See Table 11.)

NOTE: A 12-in. (305 mm) minimum offset pipe section is recommended with short (5 to 8 ft (1.5 to 2.4 M)) vent systems. This recommendation is to reduce excessive condensate droplets from exiting the vent pipe. (See Fig. 11, 12 or 43.)

LOCATION

Step 1 - General
This furnace must
- be installed so the electrical components are protected from water.
- not be installed directly on any combustible material other than wood flooring (refer to SAFETY CONSIDERATIONS).
- be located so combustion-air and vent pipe maximum lengths are not exceeded. Refer to Table 11.
- be located where available electric power and gas supplies meet specifications on the furnace rating plate.
- be attached to an air distribution system and be located as close to the center of the distribution system as possible. Refer to Air Ducts section.
- be provided with ample space for servicing and cleaning.

Always comply with minimum fire protection clearances shown on the furnace clearance to combustibles label.

NOTE: For upflow/downflow applications install furnace so that it is level or pitched forward within 1/2-in. (13 mm) for proper furnace operation. For horizontal applications pitch 1/4-in. (6 mm) minimum to 1/2-in. (13 mm) maximum forward to ensure proper condensate drainage from secondary heat exchangers. (See Fig. 14.)

When a furnace is installed so that supply ducts carry air circulated by the furnace to areas outside the space containing the furnace, return air must also be handled by ducts sealed to furnace casing. The ducts terminate outside the space containing the furnace to ensure a negative pressure condition will not occur within equipment room or space.

WARNING
FIRE, INJURY OR DEATH HAZARD
Failure to follow this warning could result in property damage, personal injury, or death.

Do not install furnace on its back. (See Fig. 15.) Safety control operation will be adversely affected. Never connect return-air ducts to back of furnace.
UNIT DAMAGE HAZARD

Failure to follow this caution may result in property or unit damage.

This gas furnace may be used for construction heat provided that:
- The furnace is permanently installed with all electrical wiring, piping, air filters, venting and ducting installed according to these installation instructions. A return air duct is provided, sealed to the furnace casing, and terminated outside the space containing the furnace. This prevents a negative pressure condition as created by the circulating air blower, causing a flame rollout and/or drawing combustion products into the structure.
- The furnace is controlled by a thermostat. It may not be “hot wired” to provide heat continuously to the structure without thermostatic control.
- Clean outside air is provided for combustion. This is to minimize the corrosive effects of adhesives, sealers and other construction materials. It also prevents the entrainment of drywall dust into combustion air, which can cause fouling and plugging of furnace components.
- The temperature of the return air to the furnace is maintained between 55°F (13°C) and 80°F (27°C), with no evening setback or shutdown. The use of the furnace while the structure is under construction is deemed to be intermittent operation per our installation instructions.
- The air temperature rise is within the rated rise range on the furnace rating plate, and the firing rate has been set to the nameplate value.
- The filters used to clean the circulating air during the construction process must be either changed or thoroughly cleaned prior to occupancy.
- The furnace, ductwork and filters are cleaned as necessary to remove drywall dust and construction debris from all HVAC system components after construction is completed.
- After construction is complete, verify furnace operating conditions including ignition, input rate, temperature rise and venting, according to the manufacturer’s instructions.

CAUTION

UNIT DAMAGE HAZARD

Failure to follow this caution may result in property or unit damage.

If this furnace is installed in an unconditioned space where the ambient temperatures may be 32°F (0°C) or lower, freeze protection measures must be taken. (See Fig. 16.)

Step 2 - Furnace Location Relative to Cooling Equipment

The cooling coil must be installed parallel with or on downstream side of furnace to avoid condensation in heat exchanger. When installed parallel with a furnace, dampers or other means used to control flow of air shall be adequate to prevent chilled air from entering furnace. If dampers are manually operated, they must be equipped with a means to prevent operation of either unit unless the damper is in full-heat or full-cool position.

CAUTION

UNIT DAMAGE HAZARD

Failure to follow this caution may result in property or unit damage.

If this furnace is installed in an unconditioned space where the ambient temperatures may be 32°F (0°C) or lower, freeze protection measures must be taken. (See Fig. 16.)

Step 3 - Hazardous Locations

WARNING

FIRE, EXPLOSION, INJURY OR DEATH HAZARD

Failure to follow this warning could result in personal injury, or death or property damage.

When the furnace is installed in a residential garage, the burners and ignition sources must be located at least 18 in. (457 mm) above the floor. The furnace must be located or protected to avoid physical damage by vehicles. When the furnace is installed in a public garage, airplane hangar, or other building having a hazardous atmosphere, the furnace must be installed in accordance with the NFCA or NSCNEPAC. (See Fig. 17.)

Step 4—Furnace Location and Application

DIRECT VENT (2-PIPE) APPLICATION

Furnace may be located in a confined space without special provisions for dilution or ventilation air.
Fig. 17 - Installation in a Garage

NON-DIRECT VENT (1-PIPE) APPLICATION

⚠️ CAUTION

UNIT DAMAGE HAZARD
Failure to follow this caution may result in intermittent unit operation.
Do not install furnace in a corrosive or contaminated atmosphere. Make sure all combustion and circulating air requirements are met.

Refer to the AIR FOR COMBUSTION AND VENTILATION section for details.

AIR FOR COMBUSTION AND VENTILATION

Provisions for adequate combustion, ventilation, and dilution air must be provided in accordance with:

- **Canadian Installations**: Part 8 of CAN/CSA-B149.1-05. Venting Systems and Air Supply for Appliances and all authorities having jurisdiction.

⚠️ WARNING

FURNACE CORROSION HAZARD
Failure to follow this warning could result in reduced furnace component life.
Air for combustion must not be contaminated by halogen compounds, which include fluoride, chloride, bromide, and iodide. These elements could corrode heat exchangers and shorten furnace life. Air contaminants are found in aerosol sprays, detergents, bleaches, cleaning solvents, salts, air fresheners, and other household products.

The following types of furnace installations may require OUTDOOR AIR for combustion due to chemical exposures:

- Commercial buildings
- Buildings with indoor pools
- Laundry rooms
- Hobby or craft rooms, and
- Chemical storage areas

If air is exposed to the following substances, it should not be used for combustion air, and outdoor air may be required for combustion:

- Permanent wave solutions
- Chlorinated waxes and cleaners
- Chlorine based swimming pool chemicals
- Water softening chemicals
- De-icing salts or chemicals
- Carbon tetrachloride
- Halogen type refrigerants
- Cleaning solvents (such as perchloroethylene)
- Printing inks, paint removers, varnishes, etc.
- Hydrochloric acid
- Cements and glues
- Antistatic fabric softeners for clothes dryers
- Masonry acid washing materials

All fuel-burning equipment must be supplied with air for fuel combustion. Sufficient air **must** be provided to avoid negative pressure in the equipment room or space. A positive seal **must** be made between the furnace cabinet and the return-air duct to prevent pulling air from the burner area and from draft safeguard opening.

⚠️ WARNING

CARBON MONOXIDE POISONING HAZARD
Failure to follow this warning could result in personal injury or death.
The operation of exhaust fans, kitchen ventilation fans, clothes dryers, attic exhaust fans or fireplaces could create a NEGATIVE PRESSURE CONDITION at the furnace.
Make-up air **must** be provided for the ventilation devices, in addition to that required by the furnace. Refer to the Carbon Monoxide Poisoning Hazard warning in the venting section of these instructions to determine if an adequate amount of make-up air is available.

The requirements for combustion and ventilation air depend upon whether or not the furnace is located in a space having a volume of at least 50 cubic feet per 1,000 Btuh input rating for all gas appliances installed in the space.

- Spaces having less than 50 cubic feet per 1,000 Btuh require the OUTDOOR COMBUSTION AIR METHOD.
- Spaces having at least 50 cubic feet per 1,000 Btuh may use the INDOOR COMBUSTION AIR, STANDARD or KNOWN AIR INFILTRATION METHOD.

**Outdoor Combustion Air Method**

1. Provide the space with sufficient air for proper combustion, ventilation, and dilution of flue gases using permanent horizontal or vertical duct(s) or opening(s) directly communicating with the outdoors or spaces that freely communicate with the outdoors.

2. Fig. 18 illustrates how to provide TWO OUTDOOR OPENINGS, one inlet and one outlet combustion and ventilation air openings to the outdoors.

   a. One opening **MUST** commence within 12 in. (305 mm) of the ceiling and the second opening **MUST** commence within 12 in. (305 mm) of the floor.

   b. Size openings and ducts per Fig. 18 and Table 1.

   c. TWO HORIZONTAL DUCTS require 1 square inch of free area per 2,000 Btuh (1,100 mm²/kW) of combined input for all gas appliances in the space per Fig. 18 and Table 1.

   d. TWO OPENINGS OR VERTICAL DUCTS require 1 square inch of free area per 4,000 Btuh (550 mm²/kW) for combined input of all gas appliances in the space per Fig. 18 and Table 1.

3. ONE OUTDOOR OPENING requires:

   a. 1 square inch of free area per 3,000 Btuh (734 mm²/kW) for combined input of all gas appliances in the space per Table 1 and 11.
Table 1 – Minimum Free Area Required for Each Combustion Air Opening or Duct to Outdoors

b. Not less than the sum of the areas of all vent connectors in the space.

The opening shall commence within 12 in. (305 mm) of the ceiling. Appliances in the space shall have clearances of at least 1 in. (25 mm) from the sides and back and 6 in. (153 mm) from the front. The opening shall directly communicate with the outdoors or shall communicate through a vertical or horizontal duct to the outdoors or spaces (crawl or attic) that freely communicate with the outdoors.

Indoor Combustion Air © NFPA & AGA

Standard and Known-Air-Infiltration Rate Methods

Indoor combustion air is permitted for combustion, ventilation, and dilution, if the Standard or Known-Air-Infiltration Rate Method is used.

⚠️ WARNING

CARBON MONOXIDE POISONING HAZARD

Failure to follow this warning could result in death and/or personal injury.

Many homes require air to be supplied from outdoors for furnace combustion, ventilation, and dilution of flue gases. The furnace combustion air supply must be provided in accordance with this instruction manual.

The Standard Method:

1. The space has no less volume than 50³ ft. (1.4³ M) per 1,000 Btu/h of the maximum input ratings for all gas appliances installed in the space and
2. The air infiltration rate is not known to be less than 0.40 air changes per hour (ACH).

The Known Air Infiltration Rate Method shall be used, if the infiltration rate is known to be:

1. Less than 0.40 ACH and
2. Equal to or greater than 0.10 ACH

Infiltration rates greater than 0.60 ACH shall not be used. The minimum required volume of the space varies with the number of ACH and shall be determined per Table 2 or Equations 1 and 2. Determine the minimum required volume for each appliance in the space and add the volumes together to get the total minimum required volume for the space.

Table 2 - Minimum Space Volumes were determined by using the following equations from the National Fuel Gas Code ANSI Z223.1-2009/NFPA 54-2009,9.3.2.2:
Fig. 18 - Air for Combustion, Ventilation, and Dilution for Outdoors

1. For other than fan-assisted appliances, such as a draft hood-equipped water heater:

\[
\text{Volume}_{\text{other}} = \frac{\text{I}_{\text{other}}}{\text{ACH} \cdot 1,000 \text{ Btu/hr}}
\]

2. For fan-assisted appliances such as this furnace:

\[
\text{Volume}_{\text{fan}} = \frac{\text{I}_{\text{fan}}}{\text{ACH} \cdot 1,000 \text{ Btu/hr}}
\]

If:

\[\text{I}_{\text{other}} = \text{combined input of all other than fan-assisted appliances in Btu/hr}\]

\[\text{I}_{\text{fan}} = \text{combined input of all fan-assisted appliances in Btu/hr}\]

\[\text{ACH} = \text{air changes per hour (ACH shall not exceed 0.60.)}\]

The following requirements apply to the Standard Method and to the Known Air Infiltration Rate Method.

1. Adjoining rooms can be considered part of a space if:
   a. There are no closeable doors between rooms.
   b. Combining spaces on same floor level. Each opening shall have free area of at least 1 in\(^2\)/1,000 Btu (2,000 mm\(^2\)/kW) of the total input rating of all gas appliances in the space, but not less than 100 in\(^2\) (0.06 m\(^2\)). One opening shall commence within 12 in. (305 mm) of the ceiling and the second opening shall commence within 12 in. (305 mm) of the floor. The minimum dimension of air openings shall be at least 3 in. (76 mm). (See Fig. 19.)

2. An attic or crawlspace may be considered a space that freely communicates with the outdoors provided there are adequate permanent ventilation openings directly to outdoors having free area of at least 1 in\(^2\)/4,000 Btu (645.1 mm\(^2\)/1.17 KWh) of total input rating for all gas appliances.

3. In spaces that use the Indoor Combustion Air Method, infiltration should be adequate to provide air for combustion, permanent ventilation and dilution of flue gases. However, in buildings with unusually tight construction, additional air MUST be provided using the methods described in the Outdoor Combustion Air Method section. Unusually tight construction is defined as Construction with:
   a. Walls and ceilings exposed to the outdoors have a continuous, sealed vapor barrier. Openings are gasketed or sealed and
   b. Doors and openable windows are weatherstripped and
   c. Other openings are caulked or sealed. These include joints around window and door frames, between sole plates and floors, between wall-ceiling joints, between wall panels, at penetrations for plumbing, electrical and gas lines, etc.

c. Combining space on different floor levels. The volumes of spaces on different floor levels shall be considered as communicating spaces if connected by one or more permanent openings in doors or floors having free area of at least 2 in\(^2\)/1,000 Btu (4,400 mm\(^2\)/kW) of total input rating of all gas appliances.

Fig. 19 - Air for Combustion, Ventilation, and Dilution from Indoors
NOTE: In determining the free area of an opening, the blocking effect of the louvers, grilles, and screens must be considered. If the free area of a louver or grille design is unknown, it may be assumed that wood louvers have a 20 percent free area, and metal louvers or grilles have a 60 percent free area. Screens, when used, must not be smaller than 1/4-in. (6 mm) mesh. Louvers and grilles must be constructed so they cannot be closed.
When combustion air ducts are used, they must be of the same cross sectional area as the free area of the openings to which they connect. The minimum dimension of ducts must not be less than 3 in. (76 mm).

Combination of Indoor and Outdoor Air
1. Indoor openings shall comply with the Indoor Combustion Air Method below and,
2. Outdoor openings shall be located as required in the Outdoor Combustion Air Method mentioned previously and,
3. Outdoor openings shall be sized as follows:
   a. Calculate the Ratio of all Indoor Space volume divided by required volume for Indoor Combustion Air Method below.
   b. Outdoor opening size reduction Factor is 1 minus the Ratio in a. above.
   c. Minimum size of Outdoor openings shall be the size required in Outdoor Combustion Air Method above multiplied by reduction Factor in b. above. The minimum dimension of air openings shall be not less than 3 in. (76 mm).

INSTALLATION

Step 1 - Leveling Legs (If Desired)
When furnace is used in upflow position with side inlet(s), leveling legs may be desired. (See Fig. 20.) Install field-supplied, corrosion-resistant 5/16-in. machine bolts and nuts.

NOTE: The maximum length of bolt should not exceed 1-1/2 in. (38 mm).
1. Position furnace on its back. Locate and drill a 5/16-in. (8 mm) diameter hole in each bottom corner of furnace. (See Fig. 20.) Holes in bottom closure panel may be used as guide locations.
2. For each hole, install nut on bolt and then install bolt and nut in hole. (Install flat washer if desired.)
3. Install another nut on other side of furnace base. (Install flat washer if desired.)
4. Adjust outside nut to provide desired height, and tighten inside Nut to secure arrangement.

NOTE: Bottom closure must be used when leveling legs are used. See Bottom Closure Panel section.

Step 2 - Installation in Upflow and Downflow Applications

NOTE: For downflow applications, this furnace is approved for use on combustible flooring when special base (available from manufacturer) Part No. KGASB0201ALL is used. Special base is not required when this furnace is installed on manufacturer’s Coil Assembly Part No. CAR, CAR or CNPV, CNRV, or Coil Box Part No. KCAKC is used.

UNIT MAY NOT OPERATE
Failure to follow this caution may result in intermittent unit operation.
Do not bend duct flanges inward as shown in Fig. 21. This will affect airflow across heat exchangers and may cause limit cycling or premature heat exchanger failure. Remove duct flange completely or bend it inward a minimum of 210° as shown in Fig. 24.

CAUTION

Step 3 - Installation in Horizontal Applications
These furnaces can be installed horizontally in either horizontal left or right discharge position. In a crawlspace, the furnace can either be hung from floor joist or installed on suitable blocks or pad. Furnace can be suspended from each corner by hanger bolts and angle iron supports. (See Fig. 25.) Cut hanger bolts (4 each 3/8-in. all-thread rod) to desired length. Use 1 X 3/8-in. flat washers, 3/8-in. lock washers, and 3/8-in. nuts on hanger rods as shown in Fig. 25. Dimples are provided for hole locations. (See Fig. 2.)
UNIT MAY NOT OPERATE
Failure to follow this caution may result in intermittent unit operation.
The entire length of furnace MUST be supported when furnace is used in a horizontal position to ensure proper draining. When suspended, bottom brace supports sides and center blower shelf. When unit is supported from the ground, blocks or pad should support sides and center blower shelf area.

Step 4 - Air Ducts
GENERAL REQUIREMENTS
The duct system should be designed and sized according to accepted national standards such as those published by: Air Conditioning Contractors Association (ACCA), Sheet Metal and Air Conditioning Contractors National Association (SMACNA) or American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE), or consult The Air Systems Design Guidelines reference tables available from your local distributor. The duct system should be sized to handle the required system design CFM at the design static pressure.

Fig. 21 - Floor and Plenum Opening Dimensions

Fig. 22 - Furnace, Plenum, and Subbase Installed on a Combustible Floor

Fig. 23 - Furnace, Plenum, and Coil Assembly or Coil Box Installed on a Combustible Floor

Fig. 24 - Duct Flanges
When a furnace is installed so that the supply ducts carry air circulated by the furnace to areas outside the space containing the furnace, the return air must also be handled by a duct(s) sealed to the furnace casing and terminating outside the space containing the furnace. Secure ductwork with proper fasteners for type of ductwork used. Seal supply- and return-duct connections to furnace with code approved tape or duct sealer. Flexible connections should be used between ductwork and furnace to prevent transmission of vibration. Ductwork passing through unconditioned space should be insulated to enhance system performance. When air conditioning is used, a vapor barrier is recommended. Maintain a 1-in. (25 mm) clearance from combustible materials to supply air ductwork for a distance of 36 in. (914 mm) horizontally from the furnace. See NFPA 90B or local code for further requirements. For a furnace not equipped with a cooling coil, the outlet duct shall be provided with a removable access panel. This opening shall be accessible when the furnace is installed and shall be of such a size that the heat exchanger can be viewed for possible openings using light assistance or a probe can be inserted for sampling the air stream. The cover attachment shall prevent leaks.

**DUCTWORK ACOUSTICAL TREATMENT**

Metal duct systems that do not have a 90 degree elbow and 10 ft (3 M) of main duct to the first branch take-off may require internal acoustical lining. As an alternative, fibrous ductwork may be used if constructed and installed in accordance with the latest edition of SMACNA construction standard on fibrous glass ducts. Both acoustical lining and fibrous ductwork shall comply with NFPA 90B as tested by UL Standard 181 for Class 1 Rigid air ducts.

**SUPPLY AIR CONNECTIONS**

**Upflow Furnaces**

Connect supply-air duct to 3/4-in. (19 mm) flange on furnace supply-air outlet. The supply-air duct attachment must ONLY be connected to the main furnace casing. DO NOT cut main furnace casing to attach supply side air duct, humidifier, or other accessories. All accessories MUST be connected external to furnace main casing.

**Downflow Furnaces**

Connect supply-air duct to supply-air opening on furnace. The supply-air duct attachment must ONLY be connected to the main furnace casing. DO NOT cut main furnace casing to attach supply side air duct, humidifier, or other accessories. All accessories MUST be connected external to furnace main casing.

**RETURN AIR CONNECTIONS**

The furnace and its return air system shall be designed and installed so that negative pressure created by the air circulating fan cannot affect another appliance’s combustion air supply or act to mix products of combustion with circulating air, and that the air circulating fan of the furnace, if installed in an enclosure communicating with another fuel-burning appliance not of the direct-vent type, shall be operable only when any door or panel covering an opening in the furnace fan compartment or in a return air plenum on ducts in the closed position.

</tbody>
</table>

**WARNING**

FIRE HAZARD

Failure to follow this warning could result in personal injury, death or property damage.

Never connect return-air ducts to the back of the furnace. Return-air duct connections on furnace side(s) permitted in upflow applications only.
NOTES:

1. A 1-in. (25.4 mm) clearance minimum between top of furnace and combustible material.

2. The entire length of furnace must be supported when furnace is used in horizontal position to ensure proper drainage.

3. For non-direct vent/1-pipe application, bottom side combustion-air entry cannot be used when furnace is installed with hangers as shown.

Fig. 25 - Crawlspace Horizontal Application for Direct Vent/2-Pipe Installation and for Non-Direct Vent/1-Pipe Installation
Upflow Furnaces
The return-air duct must be connected to bottom, sides (left or right), or a combination of bottom and side(s) of main furnace casing. Bypass humidifier may be attached into unused side return air portion of the furnace casing. DO NOT connect any portion of return-air duct to back of furnace casing.

Downflow and Horizontal Furnaces
The return-air duct must be connected to return-air opening provided. DO NOT cut into casing sides or back to attach any portion of return-air duct. Bypass humidifier connections should be made at ductwork or coil casing sides exterior to furnace.

Step 5 - Filter Arrangement

⚠️ WARNING

FIRE, CARBON MONOXIDE AND POISONING HAZARD

Failure to follow this warning could result in personal injury, death, or property damage.

Never operate unit without a filter or with filter access door removed.

The air filter arrangement will vary due to application, furnace orientation, and filter type. The filter may be installed in an external Filter/Media cabinet (if provided) or the furnace blower compartment. Factory supplied washable filters are shipped in the blower compartment.

If a factory-supplied external Filter/Media cabinet is provided, instructions for its application, assembly, and installation are packaged with the cabinet. The Filter/Media cabinet can be used with the factory-supplied washable filter or a factory-specified high-efficiency disposable filter (see cabinet instructions).

If installing the filter in the furnace blower compartment, determine location for filter and relocate filter retaining wire if necessary. See Table 4 to determine correct filter size for desired filter location. Table 4 indicates filter size, location, and quantity shipped with this furnace. See Fig. 2 for location and size of bottom and side return-air openings.

<table>

</table>

* Factory-provided with the furnace. Filters may be field modified by cutting filter material and support rods (3) in filters. Alternate sizes and additional filters may be ordered from your distributor or dealer.
† Upflow only. Alternate sizes and additional filters may be ordered from your dealer.

Fig. 26 - Filter Installed for Side Inlet

Fig. 27 - Bottom Filter Arrangement
Fig. 28 - Removing Bottom Closure Panel

### CAUTION

**CUT HAZARD**
Failure to follow this caution may result in personal injury.
Use care when cutting support rods in filters to protect against flying pieces and sharp rod ends. Wear safety glasses, gloves, and appropriate protective clothing.

### CAUTION

**UNIT MAY NOT OPERATE**
Failure to follow this caution may result in intermittent unit operation.
For airflow requirements above 1800 CFM, see Air Delivery table in Product Data literature for specific use of single side inlets. The use of both side inlets, a combination of 1 side and the bottom, or the bottom only will ensure adequate return air openings for airflow requirements above 1800 CFM.

**NOTE:** Side return-air openings can ONLY be used in UPFLOW configurations. Install filter(s) as shown in Fig. 26. Bottom return-air opening may be used with all 4 orientations. Filter may need to be cut to fit some furnace widths. Install filter as shown in Fig. 27.

**NOTE:** Remove and discard bottom closure panel when bottom inlet is used.

### Step 6 - Bottom Closure Panel

This furnace is shipped with bottom closure panel installed in bottom return-air opening. This panel MUST be in place when side return air is used.

To remove bottom closure panel, perform the following:

1. Tilt or raise furnace and remove 2 screws holding front filler panel. (See Fig. 28.)
2. Rotate front filler panel downward to release holding tabs.
3. Remove bottom closure panel.
4. Reinstall front filler panel and screws.

* Cubic ft of gas per hr. for gas pressures of 0.5 psig (14-in. WC) or less and a pressure drop of 0.5-in wc (based on a 0.60 specific gravity gas). Ref: Table 5 and the NFGC.

### Step 7 - Gas Piping

Gas piping must be installed in accordance with national and local codes. Refer to current edition of NFGC in the United States.

Canadian installations must be made in accordance with NCSPNGPIC and all authorities having jurisdiction.

Gas supply line should be a separate line running directly from meter to furnace, if possible. Refer to Table 5 for recommended gas pipe sizing.

Risers must be used to connect to furnace and to meter. Support all gas piping with appropriate straps, hangers, etc. Use a minimum of 1 hanger every 6 ft (1.8 M). Joint compound (pipe dope) should be applied sparingly and only to male threads of joints. Pipe dope must be resistant to propane gas.

**WARNING**

**FIRE OR EXPLOSION HAZARD**
Failure to follow this warning could result in personal injury, death or property damage.

- Connect gas pipe to furnace using a backup wrench to avoid damaging gas controls.
- Gas valve shutoff switch MUST be facing forward or tilted upward.
- Never purge a gas line into a combustion chamber. Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections.
- Use proper length of pipe to avoid stress on gas control manifold.
- If a flexible connector is required or allowed by authority having jurisdiction, black iron pipe shall be installed at furnace gas valve and extend a minimum of 2 in. (51 mm) outside furnace casing.
- Protect gas valve from water and debris. Gas valve inlet and/or inlet piping must remain capped until gas supply line is permanently installed to protect the valve from moisture and debris. Also, install a sediment trap in the gas supply piping at the inlet to the gas valve.

Install a sediment trap in riser leading to furnace. Trap can be installed by connecting a tee to riser leading to furnace so straight-through section of tee is vertical. Then connect a capped nipple into lower end of tee. Capped nipple should extend below level of gas controls. Place a ground joint union between gas control manifold and manual gas shutoff valve. (See Fig. 29.)
If local codes allow the use of a flexible gas appliance connector, always use a new listed connector. Do not use a connector which has previously served another gas appliance.

An accessible manual shutoff valve MUST be installed external to furnace casing and within 6 ft (1.8 M) of furnace. A 1/8-in. NPT plugged tapping, accessible for test gauge connection, MUST be installed immediately upstream of gas supply connection to furnace and downstream of manual shutoff valve.

Piping should be pressure tested in accordance with NFGC, local and national plumbing and gas codes before the furnace has been connected. In Canada, refer to current edition of NSCNGPIC. If the pressure exceeds 0.5 psig (14 IN. WC), gas supply pipe must be disconnected from the furnace and capped before pressure test. If test pressure is equal to or less than 0.5 psig (14-IN. WC), turn off electric shutoff switch located on furnace gas valve and accessible manual shutoff valve before test. After all connections have been made, purge lines and check for leakage.

Gas line grommet (factory-supplied loose parts bag) should be used when installing gas piping. Gas line entry hole filler plug should be installed in unused gas line entry hole. (See Fig. 30.)

**NOTE:** The gas valve inlet pressure tap connection is suitable to use as test gauge connection providing test pressure DOES NOT exceed maximum 0.5 psig (14-IN. WC) stated on gas valve. (See Fig. 58.)

The gas supply pressure shall be within the maximum and minimum inlet supply pressures marked on the rating plate with the furnace burners ON at HI-HT and OFF.

* Permissible limits of voltage range at which unit will operate satisfactorily.
† Unit ampacity = 125 percent of largest operating component’s full load amps plus 100 percent of all other potential operating components (EAC, humidifier, etc.) full load amps.
‡ Length shown is measured 1 way along wire path between unit and service panel for maximum 2 percent voltage drop.
** Time-delay type is recommended.
Step 8 - Electrical Connections

⚠️ WARNING

**ELECTRICAL SHOCK HAZARD**
Failure to follow this warning could result in personal injury or death.
Blower access door switch opens 115-v power to furnace control. No component operation can occur. Do not bypass or close switch with panel removed.

⚠️ CAUTION

**UNIT MAY NOT OPERATE**
Failure to follow this caution may result in intermittent unit operation.
Furnace control must be grounded for proper operation or control will lock out. Control is grounded through green/yellow wire routed to gas valve C-terminal and burner box screw.

See Fig. 31, 32, and 50-57 for field wiring diagram showing typical field 115-v and 24-v wiring. Check all factory and field electrical connections for tightness.
Field-supplied wiring shall conform with the limitations of 63° rise.

**115-V WIRING**
Before proceeding with electrical connections, make certain that voltage, frequency, and phase correspond to that specified on the furnace rating plate. Also, check to be sure that service provided by power supply is sufficient to handle load imposed by this equipment. Refer to rating plate or Table 6 for equipment electrical specifications.
The furnace must be electrically grounded in accordance with local codes; or in the absence of local codes, with the National Electric Code ANSI/NFPA 70 and/or the Canadian Electric Code, CSA C22.1, Part I, if an external electrical source is utilized.
Fig. 31 - Typical Heating and Cooling Application Wiring Diagram 1-Stage Thermostat and Condensing Unit

NOTES:
1. Connect Y-terminal as shown for proper operation.
2. Some thermostats require a "C" terminal connection as shown.
3. If any of the original wire, as supplied, must be replaced, use same type or equivalent wire.

Fig. 32 - Typical Heating and Cooling Application Wiring Diagram 2-Stage Thermostat and Condensing Unit

NOTES:
1. Connect Y-terminal as shown for proper operation.
2. Some thermostats require a "C" terminal connection as shown.
3. If any of the original wire, as supplied, must be replaced, use same type or equivalent wire.
Use a separate, fused branch electrical circuit containing a properly sized fuse or circuit breaker for this furnace. See Table 6 for wire size and fuse specifications. A disconnecting means must be located within sight from and readily accessible to furnace.

**NOTE:** If polarity is incorrect or the furnace is not grounded, control LED status indicator light will flash rapidly and furnace will NOT operate.

---

**WARNING**

**FIRE HAZARD**

Failure to follow this warning could result in intermittent operation.

Do not connect aluminum wire between disconnect switch and furnace. Use only copper wire. (See Fig. 33.)

---

**WARNING**

**ELECTRICAL SHOCK AND FIRE HAZARD**

Failure to follow this warning could result in personal injury, death or property damage.

The furnace casing MUST have an uninterrupted or unbroken ground according to NEC ANSI/NFPA 70-2008 and Canadian Electrical Code CSA C22.1 or local codes to minimize personal injury if an electrical fault should occur. This may consist of electrical wire or conduit approved for electrical ground when installed in accordance with existing electrical codes. Do not use gas piping as an electrical ground.

Factory Installed J-Box Location

Install electrical entry hole filler plugs (factory-supplied in loose parts bag) in unused power entry holes. (See Fig. 34)

**J-Box Relocation**

1. Remove 2 screws holding auxiliary J-box. (See Fig. 35.)
2. Rotate J-box 180° and attach box to left side, using holes provided.
3. Install electrical entry hole filler plugs (factory-supplied loose parts Bag) in unused power entry holes. (See Fig. 35.)

---

**WARNING**

**ELECTRICAL SHOCK AND FIRE HAZARD**

Failure to follow this warning could result in personal injury, death, or property damage.

If manual disconnect switch is to be mounted on furnace, select a location where a drill or fastener will not contact electrical or gas components.

---

**24-V WIRING**

Make field 24-v connections at 24-v terminal block on furnace. (See Fig. 36.) Connect terminal Y/Y2 as shown in Fig. 31 and 32 for proper cooling operation. Use only AWG No. 18, color-coded, copper thermostat wire for lengths up to 100 ft. For wire lengths over 100 ft, use AWG No. 16 wire.

The 24-v circuit contains an automotive-type, 3-amp fuse located on furnace control. (See Fig. 37.) Any direct shorts of 24-v wiring during installation, service, or maintenance could cause this fuse to blow. If fuse replacement is required, use ONLY a 3-amp fuse of identical size/type. The control will flash code 24 when fuse needs replacement.

---

**ACCESSORIES**

1. **Electronic Air Cleaner (EAC)** Two male quick-connect terminals marked EAC-1 and EAC-2 are provided for EAC connection. (See Fig. 36 or 37.) These terminals are energized with 115-v (1.0-amp maximum) during blower motor operation.

2. **Humidifier (HUM)** Connect an accessory 24 VAC, 0.5 amp maximum humidifier (if used) to the 1/4-in. male quick-connect HUM terminal and COM-24V screw terminal on the control board thermostat strip. The HUM terminal is energized when gas valve is energized. (See Fig. 36 or 37.)

**NOTE:** A field-supplied, 115–v controlled relay connected to EAC terminals may be added if humidifier operation is desired during blower operation.

---

**UNIT DAMAGE HAZARD**

Failure to follow this caution may result in unit component damage.

DO NOT connect furnace control HUM terminal to HUM (humidifier) terminal on Thermidistat™, Zone Controller or similar device. See Thermidistat™, Zone Controller, thermostat, or controller manufacturer’s instructions for proper connection.

---

**CAUTION**

**Step 9 - Removal of Existing Furnaces from Common Vent Systems**

When an existing Category I furnace is removed or replaced, the original venting system may no longer be sized to properly vent the remaining attached appliances. An improperly sized Category I venting system could cause the formation of condensate in the furnace and vent, leakage of condensate and combustion products, spillage of combustion products into the living space, etc.
Step 10 - Combustion Air and Vent Pipe Systems

**GENERAL**

Vent system or vent connectors may need to be resized. For any other appliances when resizing vent systems or vent connectors, system or connector must be sized to approach minimum size as determined using appropriate table found in the NFGC or NSCNPIC.

The 58MEC can be vented as either a direct vent or as a non-direct vent application. A direct vent system shall be installed in accordance with the direct vent (2-pipe) procedures in the following Combustion Air and Vent Pipe Systems section. For non-direct vent (1-pipe) applications, refer to the non-direct vent (1-pipe) procedures in the same section.

Multistory and common venting are prohibited.

**DIRECT VENT/2-PIPE SYSTEM**

In a direct-vent (2-pipe) system, all air for combustion is taken directly from outdoor atmosphere, and all flue products are discharged to outdoor atmosphere. A factory accessory vent termination kit MUST be used in a direct vent (2-pipe) system.

**NON-DIRECT VENT/1-PIPE SYSTEM**

In a non-direct vent (1-pipe) system, all air for combustion is taken from the area adjacent to furnace, and all flue products are discharged to outdoor atmosphere. A factory-supplied perforated disk assembly (in loose parts bag) MUST be used in combustion-air pipe elbow.

**MATERIALS**

Combustion-air and vent pipe, fittings, primers, and solvents must conform to American National Standards Institute (ANSI) standards and American Society for Testing and Materials (ASTM) standards. See Table 7 for approved materials for use in the U.S.A.

---

**WARNING**

**CARBON MONOXIDE POISONING HAZARD**

Failure to follow the steps outlined below for each appliance connected to the venting system being placed into operation could result in carbon monoxide poisoning or death.

The following steps shall be followed for each appliance connected to the venting system being placed into operation, while all other appliances connected to the venting system are not in operation:

1. Seal any unused openings in venting system.
2. Inspect the venting system for proper size and horizontal pitch, as required in the National Fuel Gas Code, ANSI Z223.1-2009/NFPA 54-2009 or the CSA B149.1, Natural Gas and Propane Installation Code and these instructions. Determine that there is no blockage or restriction, leakage, corrosion and other deficiencies, which could cause an unsafe condition.
3. As far as practical, close all building doors and windows and all doors between the space in which the appliance(s) connected to the venting system are located and other spaces of the building.
5. Turn on clothes dryers and any appliance not connected to the venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they are operating at maximum speed. Do not operate a summer exhaust fan.
6. Follow the lighting instructions. Place the appliance being inspected into operation. Adjust the thermostat so appliance is operating continuously.
7. Test for spillage from draft hood equipped appliances at the draft hood relief opening after 5 minutes of main burner operation. Use the flame of a match or candle.
8. If improper venting is observed during any of the above tests, the venting system must be corrected in accordance with the National Fuel Gas Code, ANSI Z223.1-2009/NFPA 54-2009 and/or CSA B149.1, Natural Gas and Propane Installation Code.
9. After it has been determined that each appliance connected to the venting system properly vents when tested as outlined above, return doors, windows, exhaust fans, fireplace dampers and any other gas-fired burning appliance to their previous conditions of use.

**WARNING**

**FIRE AND EXPLOSION HAZARD**

Failure to follow this warning could result in property damage, personal injury, or death.

Solvent cements are combustible. Keep away from heat, sparks, and open flame. Use only in well-ventilated areas. Avoid breathing in vapor or allowing contact with skin or eyes.

For Canadian installations, refer to Page 1 for instructions.

In direct vent (2-pipe) systems, combustion air and vent pipes must terminate together in same atmospheric pressure zone, either through roof or sidewall (roof termination preferred), using accessory termination kit. See Table 8 for required clearances.

In non-direct vent (1-pipe) system, vent pipe termination must be installed with adequate clearances to building openings and equipment to comply with national and local codes. See Table 9 for required clearances.

**WARNING**

**CARBON MONOXIDE POISONING AND PROPERTY DAMAGE HAZARD**

Failure to follow this warning could result in property damage, personal injury, or death.

All combustion-air and vent pipes must be airtight and watertight. Pipes must also terminate exactly as shown in Fig. 44 for direct vent (2-pipe) system and Fig. 45 for non-direct vent (1-pipe) system.

An abandoned masonry chimney may be used as a raceway for properly insulated and supported combustion-air (when applicable) and vent pipes. Each furnace must have its own set of combustion-air and vent pipes and be terminated individually, as shown in Fig. 44 for Direct Vent (2-Pipe) system and Fig. 45 for Non-Direct Vent (1-Pipe) system.

A furnace shall not be connected to a chimney flue serving a separate appliance designed to burn solid fuel.

Other gas appliances with their own venting system may also use the abandoned chimney as a raceway providing it is permitted by local code, the current edition of the National Fuel Gas Code and the vent or liner manufacturer’s installation instructions. Care must be taken to prevent the exhaust gases from one appliance from contaminating the combustion air of other gas appliances.

**WARNING**

**UNIT MAY NOT OPERATE**

Failure to follow this caution may result in intermittent unit operation.

When vent pipe is exposed to temperatures below freezing, such as when it passes through an unheated space or when a chimney is used as a raceway, pipe must be insulated as shown in Table 10 with Armaflex-type insulation.

Furnace combustion air and vent pipe connections are sized for 2-in. (51 mm) pipe. Any pipe size change should be made outside furnace casing in vertical pipe. The transition has to be made as close to the furnace as reasonably possible.

**COMBUSTION AIR PIPE**

**General**

Furnace combustion-air connection must be attached as shown in Fig. 38. Combustion-air intake housing plug may need to be relocated in some applications.

For Non-Direct Vent (1-Pipe) system, combustion-air must terminate outside of furnace casing with 1 elbow. Orient elbow so that its opening faces down for upflow or downflow applications. Orient elbow so that its opening faces sideways (left or right) for horizontal left or horizontal right applications. Maintain a 3-in minimum clearance between the opening of the combustion-air inlet pipe and any object.
UNIT CORROSION HAZARD

Failure to follow this warning could result in personal injury, death or property damage. Combustion air must not be taken from inside structure because inside air is frequently contaminated by halogens, which include fluorides, chlorides, bromides, and iodides. These elements are found in aerosols, detergents, bleaches, cleaning solvents, salts, air fresheners, adhesives, paint, and other household products. Locate combustion-air inlet as far as possible from swimming pool and swimming pool pump house.

NOTE: All pipe joints must have cemented attachment of combustion-air inlet pipe to inlet housing connection, since it may be necessary to remove pipe for servicing.

Assembly of Combustion Air Pipe (Non-Direct Vent/1-Pipe System ONLY)

1. Permanently install perforated disk assembly (factory-supplied in loose parts bag) in combustion-air elbow using RTV or by cementing, as shown in Fig. 39. For 120,000 Btuh size units only: separate the 2 halves of perforated disk assembly and use only the shouldered disk half.
2. Determine the length of straight portion of combustion-air inlet pipe from Fig. 39.
3. Cut field-supplied 2-in. (51 mm) diameter PVC pipe to length as determined per Fig. 39.
4. Permanently attach elbow/perforated disk assembly to straight portion of pipe using RTV or by cementing as shown in Fig. 39.

Assembly of Combustion Air Pipe (Direct Vent-2-Pipe System ONLY)

Determine combustion-air and vent pipe diameter.

1. Using Table 11, individually determine the diameter of the combustion-air and vent pipe allowed. If different, pick the larger of these two diameters and use this diameter for both combustion-air vent pipes.
2. When installing vent systems of short pipe length, use the smallest allowable pipe diameter. Do not use pipe size greater than required or incomplete combustion, flame disturbance, or flame sense lockout may occur.

NOTE: Do not count elbows or pipe sections in terminations or within furnace (All elbows shown in Fig. 44 and Fig. 45 are not to be counted).

UNIT MAY NOT OPERATE

Failure to follow this caution may result in intermittent furnace operation. When installing combustion air and vent system of short pipe length, the smallest allowable pipe diameter must be used.

NOTE: A 2-in. (51 mm) diameter pipe must be used within furnace casing. Make all pipe diameter transitions outside furnace casing per Fig. 41.

3. If required per Table 11, insert perforated disk assembly (factory-supplied in loose parts bag) in intake housing where combustion air pipe will be connected. If half disk set is required, install only shouldered disk half.

(1) In accordance with the current CSA B149.1, Natural Gas and Propane Installation Code
(2) In accordance with the current ANSI Z223.1/NFPA 54, National Fuel Gas Code
# 18” (46 cm) above roof surface
+ Permitted only if veranda, porch, deck, or balcony is fully open on a minimum of two sides beneath the floor.
* For clearances not specified in ANSI Z223.1/NFPA 54 or CSA B149.1, clearances shall be in accordance with local installation codes and the requirements of the gas supplier and the manufacturer's installation instructions
** A vent shall not terminate above a sidewalk or paved driveway that is located between two single family dwellings and serves both dwellings.

Notes:
1. The vent for this appliance shall not terminate:
   a. Over public walkways;
   b. Near soffit vents or crawl space vents or other areas where condensate or vapor could create a nuisance or hazard or property damage; or
   c. Where condensate or vapor could cause damage or could be detrimental to the operation of regulators, relief valves, or other equipment.
2. When locating vent terminations, consideration must be given to prevailing winds, location, and other conditions which may cause recirculation of the combustion products of adjacent vents.
   Recirculation can cause poor combustion, inlet condensate problems, and accelerated corrosion of the heat exchangers.
3. Avoid venting under a deck or large overhang. Recirculation could occur and cause performance or system problems.

</tbody>
</table>

* Pipe length (ft / M) specified for maximum pipe lengths located in unconditioned spaces. Pipes located in unconditioned space cannot exceed total allowable pipe length as specified in Table 11.
† Insulation thickness based on R value of 3.5 per in.

Attachment of Combustion Air Pipe
1. Determine location of combustion air intake pipe connection to combustion air intake housing as shown in Fig. 38 for application.
2. Reposition combustion air intake housing plug fitting in appropriate unused intake housing connection.
3. Install combustion-air pipe grommet (factory-supplied in loose parts bag) into selected furnace casing combustion-air pipe hole. (See Fig. 40.)
4. Insert assembled combustion air inlet pipe into intake housing as shown in Fig. 38.
5. Drill a 1/8-in. (3 mm) hole in 2-in. (51 mm), combustion air pipe using the hole in intake housing as a guide.
6. Install a field-supplied No. 6 or No. 8 sheet metal screw into combustion air pipe.
7. Install casing hole filler cap (factory-supplied in loose parts bag) in unused combustion air pipe casing hole.

NOTE: Do not attach combustion air intake pipe permanently to combustion air intake housing since it may be necessary to remove pipe for service of burner box components or flame sensor.

Attachment of Combustion Air Intake Housing Plug Fitting

The combustion-air intake plug fitting must be installed in unused combustion air intake housing. This fitting must be attached by using RTV sealant, or by drilling a 1/8-in. hole in fitting, using hole in intake housing as a guide. Install a field-supplied No. 6 or No. 8 sheet metal screw.

NOTE: DO NOT OVERTIGHTEN SCREW. Breakage of intake housing or fitting may cause air leakage to occur.

A plugged drain connection has been provided on this fitting for use when moisture is found in combustion air intake pipe and combustion box. If use of this drain connection is desired, drill out fitting’s tap plug with 3/16-in. (5 mm) drill and connect a field-supplied 3/8-in. (10 mm) tube. This tube should be routed to open condensate drain for furnace and A/C (if used), and should be trapped, as shown in Fig. 42.

NOTE: (Direct Vent/2-Pipe System ONLY). Moisture in combustion air intake may be a result of improper termination. Ensure combustion air pipe termination is similar to those as shown in Fig. 44 so that it will not be susceptible to area where light snow or other sources of moisture could be pulled in.

VENT PIPE

General
Furnace vent connection must be attached as shown in Fig. 38.

WARNING

CARBON MONOXIDE POISONING AND PROPERTY DAMAGE HAZARD
Failure to follow this warning could result in property damage, personal injury, or death.
Vent pipes must be airtight.

NOTE: A 2-in. (51 mm) diameter pipe must be used within the furnace casing. Make all pipe diameter transitions outside furnace casing per Fig. 41.
The minimum vent pipe length for these furnaces is 5 ft. (1.5 M). Short pipe lengths (5-8 ft (1.5 - 2.4 M)) may discharge condensate droplets. These condensate droplets may be undesirable. A 12-in. (305 mm) minimum offset pipe section is recommended to reduce excessive condensate droplets from exiting vent pipe outlet. (See Fig. 43.)

Attachment of Vent Pipe
1. Determine vent pipe diameter and maximum pipe lengths using Table 11.
Select 1 vent pipe connection and 1 combustion-air pipe connection.

NOTE: Do not count elbows or pipe sections in terminations or within furnace (all elbows shown in Fig. 44 and 45 are not be to counted).

2. Determine location of vent pipe connection to inducer housing as shown in Fig. 38 for application.
3. Install vent pipe grommet (factory-supplied in loose parts bag) into selected furnace casing vent pipe hole. (See Fig. 40.)
4. Reposition elastomeric (rubber) inducer housing outlet cap and clamp to appropriate unused inducer housing connection. Tighten clamp.

**WARNING**

CARBON MONOXIDE POISONING AND PROPERTY DAMAGE HAZARD

Failure to follow this warning could result in property damage, personal injury or death.

Inducer housing outlet cap must be installed and fully seated against inducer housing. Clamp must be tightened to prevent any condensate leakage.

5. Be certain that mating surfaces of inducer housing connection elastomeric (rubber) coupling, and 2-in. (51 mm) diameter vent pipe are clean and dry. Assemble the elastomeric (rubber) vent coupling (with 2 loose clamps) onto inducer housing connection. Insert the 2-in. (51 mm) diameter vent pipe through the elastomeric (rubber) coupling and fully into inducer housing connection until it touches a stop inside the inducer housing outlet. Tighten the screws on both clamps to 15-in.-lb. of torque. pipe to inducer housing. Tighten the clamp screws to 15 in.-lb. of torque.

NOTE: Starting at furnace, slope vent pipe a minimum of 1/4-in. (6 mm) per linear ft with no sags between hangers.

* Disk usage – Unless otherwise specified, use perforated disk assembly (factory-supplied in loose parts bag).
# If one disk is stated, separate 2 halves of perforated disk assembly and use shouldered disk half. When using shouldered disk half, install screen side toward inlet box.
† Wide radius elbow
† Hand: Vent sizing for Canadian installations over 4500 ft. (1370 M) above sea level are subject to acceptance by the local authorities having jurisdiction.
NA – Not Allowed: pressure switch will not make.

**NOTES:**
1. Do not use pipe size greater than those specified in table or incomplete combustion, flame disturbance, or flame sense lockout may occur.
2. Size both the combustion—air and vent pipe independently, then use the larger diameter for both pipes.
3. Assume two 45° elbows equal one 90° elbow. Wide radius elbows are desirable and may be required in some cases.
4. Elbows and pipe sections within the furnace casing and at the vent termination should not be included in vent length or elbow count.
5. The minimum pipe length is 5 ft. (1.5 M) for all applications.
6. Use 3-in. (76 mm) diameter vent termination kit for installations requiring 4-in. (102 mm) diameter pipe.
6. Install casing hole filler cap (factory-supplied in loose parts bag) in unused vent pipe casing hole.

**Attachment of Vent Extension Pipe**

Furnaces with 100,000 Btuh and larger input are supplied with a PVC vent extension pipe (2-in. (51 mm) diameter by 12-in. (305 mm) long). This pipe has a built-in channel to assist vent condensate disposal. When this vent extension pipe is supplied, it MUST be used to connect the field vent pipe to furnace inducer housing on ALL upflow and downflow applications.

**NOTE:** See label on vent extension pipe for proper installation. This pipe may be shortened if an elbow is used to connect vent extension tube to field-installed vent pipe.

**Installation Guidelines for Combustion Air Pipe and Vent Pipe**

It is recommended that all pipes be cut, prepared, and pre-assembled before permanently cementing any joint.

1. Attach combustion air pipe and vent pipe per instructions in sections “Combustion Air Pipe” and “Vent Pipe.”
2. Working from furnace to outside, cut pipe to required length(s).
3. Deburr inside and outside of pipe.
4. Chamfer outside edge of pipe for better distribution of primer and cement.
5. Clean and dry all surfaces to be joined.
6. Check dry fit of pipe and mark insertion depth on pipe.
7. After pipes have been cut and preassembled, apply generous layer of cement primer to pipe fitting socket and end of pipe to insertion mark. Quickly apply approved cement to end of pipe and fitting socket (over primer). Apply cement in a light, uniform coat on inside of socket to prevent buildup of excess cement. Apply second coat.
8. While cement is still wet, twist pipe into socket with 1/4 turn. Be sure pipe is fully inserted into fitting socket.
9. Wipe excess cement from joint. A continuous bead of cement will be visible around perimeter of a properly made joint.
10. Handle pipe joints carefully until cement sets.
11. Horizontal portions of the venting system shall be supportive to prevent sagging support. Support combustion air piping (if applicable) and vent piping a minimum of every 5 ft (1.5 M) (3 ft (.9 M) for SDR-21 or -26 PVC) using perforated metal hanger strap.
12. Slope combustion air piping (if applicable) and vent piping downward towards furnace a minimum of 1/4 in. (6 mm) per linear ft with no sags between hangers.
13. Horizontal portions of the venting system shall be installed so as to prevent the accumulation of condensate.
14. Use appropriate methods to seal openings where combustion air pipe (if applicable) and vent pipe pass through roof or sidewalk.

**Fig. 40 - Pipe Grommets and Entry Hole Filler Plug Installation**
**Example:**

An 080-12 size furnace located in Indianapolis, elevation 650 ft (198 M) above sea level, could be installed as either a direct vent/2-pipe system that requires 3 elbows and 32 ft (9.7 M) of vent pipe, along with 5 elbows and 34 ft (10.3 M) of combustion-air pipe OR a non-direct vent/1-pipe system that requires 3 elbows and 32 ft (9.7 M) vent pipe.

For a direct vent/2-pipe system, Table 11 indicates this application would allow a 2 in. (51 mm) diameter vent pipe, but require a 2-1/2 in. (64 mm) diameter combustion air pipe. According to Table 14, 2-in. (51 mm) diameter pipe is good for 35 ft (11 M) with 3 elbows, but only 30 ft (9 M) with 5 elbows. Therefore, 2-1/2 in. (64 mm) diameter pipe must be used for both vent and combustion-air pipes since larger required diameter must always be used for both pipes.

For a non-direct vent/1-pipe system, Table 11 indicates that this application would allow a 2-in. (51 mm) diameter vent pipe.

If same installations were in Albuquerque, elevation 5250 ft (1600 M) above sea level:

For a direct vent/2-pipe system, Table 11 indicates that 2-1/2 (64 mm) in. diameter vent pipe and combustion-air pipe are required.

For a non-direct vent/1-pipe system, Table 11 indicates that 2-1/2 in. (64 mm) diameter vent pipe is required.

If same applications are to be installed at 5001 to 6000 ft (1524 to 1828 M) elevation:

For a direct vent/2-pipe system, 2-in. pipe is only good for 23 ft (7 M) (with 3 elbows) and 17 ft (5 M) (with 5 elbows). Therefore, 2-1/2 in. (64 mm) diameter combustion air and vent pipe must be used.

For a non-direct vent/1-pipe system, a 2-in. diameter pipe is only good for 23 ft (7.0 M) with 3 elbows. A 2-1/2-in. (64 mm) diameter vent pipe must be used.
VENT TERMINATION

General
Combustion-air (direct vent/2-pipe system only) and vent pipe must terminate outside structure, either through sidewall or roof. For vent termination clearance, refer to Table 8 for Direct Vent/2-Pipe system and Table 9 for Non-direct Vent/1-Pipe system. For exterior piping arrangements, refer to Fig. 44 for Direct Vent/2-Pipe system and Fig. 45 for Non-Direct/1-Pipe system.

Roof termination is preferred since it is less susceptible to damage or contamination, and it has less visible vent vapors. Sidewall termination requires sealing or shielding of building surfaces with a corrosive resistance material due to corrosive combustion products of vent system.

NOTE: (Direct Vent/2-Pipe system ONLY). A factory accessory termination kit MUST be used. See section “Vent Termination Kit (Direct Vent/2-Pipe System Only)” in this instruction.

When determining appropriate location for termination, consider the following guidelines:
1. Comply with all clearance requirements stated in Table 8 or 9 per application.
2. Termination or termination kit should be positioned where vent vapors will not damage plants/shrubs or air conditioning equipment.
3. Termination or termination kit should be positioned so that it will not be affected by wind eddy, such as inside building corners, nor by recirculation of flue gases, airborne leaves, or light snow.
4. Termination or termination kit should be positioned where it will not be damaged by or subjected to foreign objects such as stones, balls, etc.
5. Termination or termination kit should be positioned where vent vapors are not objectionable.

Extended Exposed Sidewall Pipes
Sidewall combustion air pipe termination (direct vent/2-pipe system only) and vent pipe termination may be extended beyond area shown in Fig. 44 or in Fig. 45 per application in outside ambient by insulating pipe as indicated in Table 10.

1. Determine combustion air pipe diameter (direct vent/2-pipe system only) and vent pipe diameter, as stated above, using total pipe length and number of elbows.
2. Using winter design temperature (used in load calculations), find appropriate temperature for your application and furnace model.
3. Determine required insulation thickness for exposed pipe length(s).

NOTE: Pipe length (ft / M) specified for maximum pipe lengths located in unconditioned spaces cannot exceed total allowable pipe length as specified in Table 11.

Vent Termination Kit (Direct Vent/2-Pipe System Only)
NOTE: Always refer to the instructions in termination kit for the latest version.
At least 36 in. (914mm)

18 in. max. (457mm)

Vertical separation between combustion air and vent
6 1/4 in. (159mm) for 3 in. (76mm) inlet
8 3/4 in. (222mm) for 2 in. (51mm) inlet

Maintain 13 in. (330mm) minimum clearance above highest anticipated snow level; maximum of 24 in. (610mm) above roof.

Note: "A" denotes 0 to < 2 in. (51mm)
Between the first 2 vents
Third vent must be > 36 in. away (914mm)

Roof Termination (Preferred)

Vent

Abandoned masonry used as raceway (per code)

Maintain 12 in. (305mm) minimum clearance above highest anticipated snow level; maximum of 24 in. (610mm) above roof.

Fig. 44 - Combustion Air and Vent Pipe Termination for Direct Vent (2-pipe) System

A05090

Fig. 45 - Vent Pipe Termination for Non-Direct Vent (1-pipe) System

A05091
Combustion air and vent pipes MUST terminate outside structure. A factory accessory termination kit must be installed as shown in Table 12. There are four options of vent/combustion air termination kits available as shown in Table 12.

**NOTE:** Combustion air pipe must have the same diameter as vent pipe.

**Concentric Vent/Combustion Air Termination Kit (Direct Vent/2-Pipe System Only)**

Determine an appropriate location for termination kit using the guidelines provided in section “Vent Termination: General” in this instruction.

1. Cut one 4-in. (102 mm) diameter hole for 2-in.(51 mm) kit, or one 5-in. (127 mm) diameter hole for 3-in. (76 mm) kit.
2. Loosely assemble concentric vent/combustion air termination components together using instructions in kit.
3. Slide assembled kit with rainshield REMOVED through hole.

**NOTE:** Do not allow insulation or other materials to accumulate inside of pipe assembly when installing it through hole.

**Roof terminations** - Locate assembly through roof to appropriate height as shown in Fig. 44.

**Sidewall terminations** - Locate assembly through sidewall with rain shield positioned no more than 1-in. (25 mm) from wall as shown in Fig. 44.

4. Disassemble loose pipe fittings. Clean and cement using same procedures as used for system piping.
5. Check required dimensions as shown in Fig. 44.

**Two-Pipe Termination Kit (Direct Vent/2-Pipe System Only)**

Determine an appropriate location for termination kit using the guidelines provided in section “Vent Termination: General” in this instruction.

1. Cut 2 holes, 1 for each pipe, of appropriate size for pipe size being used.
2. Loosely install elbow in bracket and place assembly on combustion-air pipe.

**Roof terminations** - Loosely install pipe coupling on properly cut vent pipe. Coupling must be positioned so bracket will mount as shown in Fig. 44. For applications using combustion-air pipe option, indicated by dashed lines in Fig. 44, install 90° street elbow into 90° elbow, making a U-fitting. A 180° U-fitting may be used.

**Sidewall terminations** - Install bracket as shown in Fig. 44. For applications using vent pipe option indicated by dashed lines in Fig. 44, rotate vent elbow 90° from position shown in Fig. 44.

3. Disassemble loose pipe fittings. Clean and cement using same procedures as used for system piping.
4. Check required dimensions as shown in Fig. 44.

**Multiventing and Vent Terminations**

When 2 or more 58MEC Furnaces are vented near each other, each furnace must be individually vented. NEVER common vent or breech vent 58MEC furnaces.

(Direct Vent/2-Pipe System ONLY) - When 2 or more 58MEC furnaces are vented near each other, 2 vent terminations may be installed as shown in Fig. 44, but next vent termination must be at least 36 in. (914 mm) away from first 2 terminations. It is important that vent terminations be made as shown in Fig. 44 to avoid recirculation of flue gases.

**Step 11 - Condensate Drain**

**CAUTION**

UNIT MAY NOT OPERATE

Failure to follow this caution may result in intermittent unit operation.

Unit must not be installed, operated, and then turned off and left in an unoccupied structure during cold weather when temperature drops to 32°F (0°C) and below unless drain trap and drain line have adequate freeze protection. See Service and Maintenance Instructions for winterizing procedure.

**GENERAL**

Condensate trap is shipped installed in the blower shelf and factory connected for UPFLOW applications. Condensate trap must be RELOCATED for use in DOWFLOW and HORIZONTAL applications.

Condensate trap MUST be used for all applications.

An external trap is not required when connecting the field drain to this condensate trap.

The field drain connection (condensate trap or drain tube coupling) is sized for 1/2-in. CPVC, 1/2-in. PVC, or 5/8-in. ID tube connection.

Drain pipe and fittings must conform to ANSI standards and ASTM D1785, D2466 or D2846. CPVC or PVC cement must conform to ASTM D2564 or F493. Primer must conform to ASTM F656. In Canada, use CSA or ULC listed schedule 40 CPVC or PVC drain pipe, fittings, and cement.

When a condensate pump is required, select a pump which is approved for condensing furnace applications. To avoid condensate spillage, select a pump with an overflow switch.

Furnace condensate is mildly acidic, typically in the pH range of 3.2 to 4.5. Due to corrosive nature of this condensate, a condensate pH neutralizing filter may be desired. Check with local authorities to determine if a pH neutralizer is required.

**APPLICATION**

The furnace, A/C, and humidifier drains may be combined and drained together. The A/C drain must have an external, field-supplied trap prior to the furnace drain connection. All drain connections (furnace, A/C, or humidifier) must be terminated into an open or vented drain as close to the respective equipment as possible to prevent siphoning of the equipment’s drain.

See Fig. 46 for example of possible field drain attachment using 1/2-in. CPVC or PVC tee for vent and A/C or humidifier drain connection.

Outdoor draining of the furnace is permissible if allowed by local codes. Caution should be taken when freezing. Ambient may freeze drain pipe and prohibit draining.
**WARNING**

PERSONAL INJURY AND PROPERTY DAMAGE HAZARD

Failure to follow this warning could result in property damage, personal injury, or death.

Excessive condensate draining may cause saturated soil conditions which could result in damage to plants.

**CONDENSATE DRAIN PROTECTION**

Freezing condensate left in condensate trap and drain line may cause cracks, and possible water damage may occur. If freeze protection is required, use condensate freeze protection accessory or equivalent 3 to 6 watt per ft at 120-v and 40°F (4°C) self-regulating, shielded, and waterproof heat tape. See Installation Instructions supplied with accessory or heat tape manufacturer’s recommendations.

1. Fold heat tape in half and wrap on itself 3 times.
2. Locate heat tape between sides of condensate trap back. (See Fig. 47.)
3. Use wire ties to secure heat tape in place. Wire ties can be positioned in notches of condensate trap sides. (See Fig. 47.)
4. Wrap field drain pipe with remaining heat tape, approximately 1 wrap per ft.
5. When using field-supplied heat tape, follow heat tape manufacturer’s instructions for all other installation guidelines.

**START-UP ADJUSTMENT AND SAFETY CHECK**

**CAUTION**

**FURNACE MAY NOT OPERATE**

Failure to follow this caution may result in furnace operation stopping and water pipes freezing during cold weather.

Furnace control must be grounded for proper operation, or control will lockout. Control is grounded through green/yellow wire connected to gas valve C-terminal and burner box screw.

---

**Step 1 - General**

The furnace must have a 115-v power supply properly connected and grounded.

**NOTE:** Proper polarity and proper grounding must be maintained for 115-v wiring. If polarity is incorrect or furnace is not grounded, control status indicator light will flash rapidly and the furnace will not operate.

Natural gas service pressure must not exceed 0.5 psig (14-IN. WC), and be no less than 0.16 psig (4.5-IN. WC). Thermostat wire connections at R and W/W1 are the minimum required for gas heating operation. W2 must be connected for 2-stage heating thermostats. C, Y/Y2, and G are required for cooling, heat pumps, and some clock thermostats. These must be made at the 24-v terminal block on the control. (See Fig. 37.)
This furnace can be installed with either a single-stage heating or a 2-stage heating thermostat.

For single-stage thermostats, connect thermostat W to W/W1 at furnace control terminal block. (See Fig. 31). For single-stage thermostats, the control will determine, based on length of previous heating on and off cycles, when to operate in low- and high-gas heat for optimum comfort. Setup switch-SW-1 (LHT) must be in the factory-shipped OFF position. See Fig. 36 and Tables 13 and 14 for setup switch information.

If a 2-stage heating thermostat is to be used, move SW-1 to ON position at end of furnace installation. This overrides built-in control process for selecting high and low fire and allows the 2-stage thermostat to select gas heating modes. The W2 from thermostat must be connected to W2 on control terminal block. (See Fig. 32 and 50 - 57.)

Before operating furnace, check each flame rollout manual reset switch for continuity. If necessary, press and release button to reset switch. The blower compartment door must be in place to complete the 115-v circuit to the furnace.

---

**FIRE HAZARD**

Failure to follow this caution may result in intermittent unit operation.

This furnace is equipped with a manual reset limit switch in the burner box area. The switch will open and shut off power to the gas valve if a flame rollout or overheating condition occurs in the burner enclosure area. DO NOT bypass the switch. Correct inadequate combustion-air supply, component failure, or restricted flue gas passageway before resetting the switch.

---

**CAUTION**

**FURNACE MAY NOT OPERATE**

Failure to follow this caution may result in intermittent unit operation.

Condensate trap must be PRIMED or proper draining may not occur. The condensate trap has internal chambers which can ONLY be primed by pouring water into the inducer drain side of condensate trap.

1. Remove upper inducer housing drain connection cap. (See Fig. 48.)
2. Connect field-supplied 1/2-in. (13 mm) ID tube to upper inducer housing drain connection.
3. Insert field-supplied funnel into tube.
4. Pour 1 quart of water into funnel/tube. Water should run through inducer housing, overfill condensate trap, and flow into open field drain. (See Fig. 49.)
5. Remove funnel and tube from inducer housing and replace drain connection cap and clamp.

**Step 3 - Purge Gas Lines**

After all connections have been made, purge the gas lines and check for leaks.
Step 4 - Sequence of Operation

Using schematic diagram in Fig. 36, follow the sequence of operation through the different modes. Read and follow diagram very carefully.

NOTE: If power interruption occurs during “call for heat” (W/W1 or W/W1 and W2), the control will run the blower for the selected blower off delay period after power is restored, if the thermostat is still calling for gas heating. The amber LED will flash code 12 during this period, after which the LED will be ON continuous as long as no faults are detected. After this period, the furnace will respond to the thermostat normally.

The blower door must be installed for power to be conducted through blower door interlock switch ILK to furnace control CPU, transformer TRAN, inducer motor IDM, blower motor BLWM, hot surface igniter HSI, and gas valve GV.

TWO-STAGE HEATING WITH SINGLE-STAGE THERMOSTAT (ADAPTIVE MODE)

(See Fig. 31 for thermostat connections.)

NOTE: Low heat-only switch, SW-1, selects either the low-heat only operation mode when ON, or adaptive heating mode when OFF, in response to a call for heat. (See Fig. 37.)

This furnace can operate as a 2-stage furnace with a single-stage thermostat because furnace control CPU includes a programmed adaptive sequence of controlled operation, which selects low-gas-heat or high-gas-heat operation. This selection is based upon the stored history of the length of previous gas heating on/off periods of the single-stage thermostat.

The furnace will start up in either low-or high-gas heat. If the furnace starts up in low-gas heat, the control CPU determines the low-gas heat on time (from 0 to 16 minutes) which is permitted before switching to high heat.

If power is interrupted, the stored history is erased. When this happens, the control CPU will initially select low heat for up to 16 minutes and then switch to high heat, as long as the thermostat remains in “call for heat.” Subsequent selection is based on stored history of thermostat cycle times.

When wall thermostat “calls for heat”, R-W/W1 circuit closes. The control performs a self-check, verifies the low-heat pressure switch LPS and HPS, and starts inducer motor IDM in high speed.

1. Inducer Prepurge Period - If the furnace control CPU selects low heat operation the inducer motor IDM comes up to speed, the low heat pressure switch LPS closes, and the furnace control CPU begins a 15-second prepurge period. After the low heat pressure switch re-closes the furnace control CPU will begin a 15-second prepurge period, and continue to run the inducer motor IDM at high speed.

If the furnace control CPU selects high heat operation, the inducer motor IDM remains running at high speed, and the high heat pressure switch relay HPSR is de-energized to close the NC contact. When sufficient pressure is available the high heat pressure switch HPS closes, and the high heat gas valve solenoid GV-HI is energized. The furnace control CPU begins a 15-second prepurge period after the low heat pressure switch LPS closes. If the high heat pressure switch HPS fails to close and the low heat pressure switch LPS closes, the furnace will operate at low heat gas flow rate until the high heat pressure switch closes for a maximum of 2 minutes after ignition.

2. Igniter Warm-Up - At end of the inducer prepurge period, the Hot Surface Igniter HSI is energized for a 17 sec igniter warm-up period.

3. Trial-For-Ignition Sequence - When the igniter warm-up period is completed the main gas valve relay contacts GVR close to energize the gas valve GV, the gas valve opens. The gas valve GV permits gas flow to the burners where it is ignited by the Hot Surface Igniter HSI. Five seconds after the GVR closes, a 2-second flame period begins. The HSI igniter will remain energized until the flame is sensed or until the 2-second flame proving period begins.

4. Flame-Proving - When burner flame is proved at the flame-proving sensor electrode FSE, the inducer motor IDM switches to low-speed unless running at high-speed, and the furnace control CPU begins the blower-off delay period and continues to hold the gas valve GV-M open. If the burner flame is not proved within two seconds, the control CPU will close the gas valve GV-M, and the control CPU will repeat the ignition sequence for up to three more Trials-For-Ignition before going to Ignition-Lockout. Lockout will be reset automatically after three hours, by momentarily interrupting 115 vac power to the furnace, or by interrupting 24 vac power at SEC1 or SEC2 to the furnace control CPU (not at W/W1, G, R, etc.). If flame is proved when flame should not be present, the furnace control CPU will lock out of Gas-Heating mode and operate the inducer motor IDM on high speed until flame is no longer proved.

5. Blower-On Delay - If burner flame is proven the blower motor BLWM is energized 66 sec after gas valve GV-M is opened.

Low heat - The blower motor BLWM is energized at LO HT speed.

High heat - The BLWM is energized at HI HT speed. Simultaneously, the electronic air cleaner terminal EAC-1 is energized and remains energized as long as the blower motor BLWM is energized.

6. Switching From Low- To High-Heat - If the furnace control CPU switches from low heat to high heat, the furnace control CPU will switch the inducer motor IDM speed from low to high. The high heat pressure switch relay HPSR is de-energized to close the NC contact. When sufficient pressure is available the high heat pressure switch HPS closes, and the high heat gas valve solenoid GV-HI is energized. The blower motor BLWM will switch to HI HT speed five seconds after the furnace control CPU switches from low heat to high heat.

7. Switching From High- To Low-Heat - The control CPU will not switch from high heat to low heat while the thermostat R-to-W circuit is closed when a single-stage thermostat is used.

8. Blower-Off delay - When the thermostat is satisfied, the R to W circuit is opened, de-energizing the gas valve GV-M, stopping gas flow to the burners, and de-energizing the humidifier terminal HUM. The inducer motor IDM will remain energized for a 15-second post-purge period. The blower motor BLWM and air cleaner terminal EAC-1 will remain energized for 90, 120, 150, or 180 seconds.
MODE

58MEC

50

(Chart for Chart)

THERMIDISTAT (NON-ADAPTIVE HEATING MODE)

(See Fig. 32 and 50-56 for thermostat connections.)

NOTE: In this mode, the low-heat only switch must be ON to select the low-heat only operation mode in response to closing the thermostat R-to-W1 circuit. Closing the thermostat R-to-W1 and-W2 circuits always causes high-heat operation, regardless of the setting of the heat-only switch.

The wall thermostat “calls for heat”, closing the R to W1 circuit for low-heat or closing the R to W1 and-W2 circuits for high-heat. The furnace control performs a self-check, verifies the low-heat and high-heat pressure switch contacts LPS and HPS are open, and starts the inducer motor IDM in high-speed.

The start-up and shutdown functions and delays described in item 1 above apply to 2-stage heating mode as well, except for switching from low-to-high-heat and vice versa.

1. Switching From Low- To High-Heat - If the thermostat R to W1 circuit is closed and the R to W2 circuit closes, the furnace control CPU will switch the inducer motor IDM speed from low to high. The high-heat pressure switch relay HPSR is de-energized to close the NC contact. When sufficient pressure is available the high-heat pressure switch HPS closes, and the high-heat gas valve solenoid GV-HI is energized. The blower motor BLWM will switch to HI HT speed five seconds after the R to W2 circuit closes.

2. Switching From High- To Low-Heat - If the thermostat R to W2 circuit opens, and the R to W1 circuit remains closed, the furnace control CPU will switch the inducer motor IDM speed from high to low. The high-heat pressure switch relay HPSR is energized to open the NC contact and de-energize the high-heat gas valve solenoid GV-HI. When the inducer motor IDM reduces pressure sufficiently, the high-heat pressure switch HPS opens. The gas valve solenoid GV-M will remain energized as long as the low-heat pressure switch LPS remains closed. The blower motor BLWM will switch to LO HT speed five seconds after the R to W2 circuit opens.

COOLING MODE

The thermostat “calls for cooling”.

1. Single-Speed Cooling

(See Fig. 31, 50, 52, or 54 for thermostat connections.) The thermostat closes R-to-G-and-Y circuits. The R-to-Y circuit starts the outdoor unit, and R-to-G-and-Y/Y2 circuits start the furnace blower motor BLWM on COOL speed. The electronic air cleaner terminal EAC-1 is energized with 115-v when blower motor BLWM is operating.

When the thermostat is satisfied, the R-to-G-and-Y circuits are opened. The outdoor unit will stop, and furnace blower motor BLWM will continue operating on COOL speed for an additional 90 sec. Jumper Y/Y2 to DHUM to reduce the cooling off-delay to 5 seconds. (See Fig. 37.)

2. Two-Speed Cooling and Single-Stage Thermostat (Adaptive Mode)

(See Fig. 31 and 50-57 for thermostat connections.) This furnace can operate a two-speed cooling unit with a single-stage thermostat because the furnace control CPU includes a programmed adaptive sequence of controlled operation, which selects low-cooling or high-cooling operation. This selection is based upon the stored history of the length of previous cooling period of the single-stage thermostat.

NOTE: The air conditioning relay disable jumper ACRDJ must be disconnected to allow thermostat control of the outdoor unit staging. (See Fig. 37.)

The thermostat closes the R to G-and-Y1 circuits for low-cooling or closes the R to G-and-Y1-and-Y2 circuits for high-cooling. The R to Y1 circuit starts the outdoor unit on low-cooling speed, and the R to G-and-Y1 circuit starts the furnace blower motor BLWM on low-cool speed (same speed as LO HT).

If the power is interrupted, the stored history is erased and the furnace control CPU will select low-cooling for up to 20 minutes and then energize the air conditioning relay ACR to energize the Y/Y2 terminal and switch the outdoor unit to high-cooling, as long as the thermostat continues to call for cooling. Subsequent selection is based on stored history of the thermostat cycle times.

The wall thermostat “calls for cooling”, closing the R to G-and-Y circuits. The R to Y1 circuit starts the outdoor unit on low-cooling speed, and the R to G-and-Y1 circuits start the furnace blower motor BLWM at low-cool speed (same speed as LO HT).

If the furnace control CPU switches from low-cooling to high-cooling, the furnace control CPU will energize the air conditioning relay ACR. When the air conditioning relay ACR is energized the R to Y1-and-Y2 circuits switch the outdoor unit to high-cooling speed, and the R to G-and-Y1-and-Y2 circuits switch the furnace blower motor BLWM to COOL speed.

NOTE: When transitioning from low-cooling to high-cooling the outdoor unit compressor will shutdown for 1 minute while the BLWM continues to run at low-cool speed (same speed as LO-HT) until the outdoor unit compressor comes back on at high speed.

The electronic air cleaner terminal EAC-1 is energized with 115 vac whenever the blower motor BLWM is operating. When the thermostat is satisfied, the R to G-and-Y circuit are opened. The outdoor unit stops, and the furnace blower BLWM and electronic air cleaner terminal EAC-1 will remain energized for an additional 90 seconds. Jumper Y1 to DHUM to reduce the cooling off-delay to 5 seconds. (See Fig. 37.)

3. Two-Speed Cooling and Two-Stage Thermostat

(See Fig. 32 and Fig. 50-57 for thermostat connections)

NOTE: The ACRDJ must be disconnected to allow thermostat control of the outdoor unit staging. (See Fig. 37.)

The thermostat closes the R to G-and-Y1 circuits for low-cooling or closes the R to G-and-Y1-and-Y2 circuits for high-cooling. The R to Y1 circuit starts the outdoor unit on low-cooling speed, and the R to G-and-Y1 circuit starts the furnace blower motor BLWM on low-cool speed (same speed as LO HT).

The R-to-Y1-and-Y2 circuits start the outdoor unit on high-cooling speed, and the R to G-and-Y2 circuits start the furnace blower motor BLWM on COOL speed.

The electronic air cleaner terminal EAC-1 is energized with 115 vac whenever the blower motor BLWM is operating.

When the thermostat is satisfied, the R-to-G-and-Y1 or R-to-Y1-and-Y2 circuits are opened. The outdoor unit stops, and the furnace blower BLWM and electronic air cleaner terminal EAC-1 will remain energized for an additional 90 seconds. Jumper Y1 to DHUM to reduce the cooling off-delay to 5 seconds. (See Fig. 37.)

THERMIDISTAT MODE

(See Fig. 50-53 for Thermidistat connections.)
The dehumidification output, DHUM on the Thermidistat should be connected to the furnace control thermostat terminal DHUM. When there is a dehumidification demand, the DHUM input is activated, which means 24 vac signal is removed from the DHUM input terminal. In other words, the DHUM input logic is reversed. The DHUM input is turned ON when no dehumidification demand exists. Once 24 vac is detected by the furnace control on the DHUM input, the furnace control operates in Thermidistat mode. If the DHUM input is low or OFF for more than 48 hours, the furnace control reverts back to non-Thermidistat mode.

The cooling operation described above also applies to operation with a Thermidistat. The exceptions are listed below:

a. When the R to G-and-Y1 circuit is closed and there is a demand for dehumidification, the furnace blower motor BLWM will continue running at low-cool speed (same speed as LO HT).

b. When the R to G-and Y/Y2 circuit is closed and there is a demand for dehumidification, the furnace blower motor BLWM will drop the blower speed from COOL to HI HT for a maximum of 10 minutes before reverting back to COOL speed. If there is still a demand for dehumidification after 20 minutes, the furnace control CPU will drop the blower speed back to HI HT speed. This alternating 10-minute cycle will continue as long as there is a call for cooling.

c. When the “call for cooling” is satisfied and there is a demand for dehumidification, the cooling blower-off delay is decreased from 90 seconds to 5 seconds.
Fig. 53 - Two-Stage Furnace with Two-Speed Heat Pump (Dual Fuel)

Fig. 54 - Dual Fuel Thermostat with Two-Stage Furnace and Single-Speed Heat Pump

Fig. 55 - Dual Fuel Thermostat With Two-Stage Furnace and Two-Speed Heat Pump

Fig. 56 - Two-Stage Thermostat With Two-Stage Furnace and Two-Speed Air Conditioner
Fig. 57 - Single-Stage Thermostat With Two-Stage Furnace and Two-Speed Air Conditioner

NOTES FOR FIG. 50-57:

1. Heat pump MUST have a high pressure switch for dual fuel applications.
2. Refer to outdoor equipment Installation Instructions for additional information and setup procedure.
3. Select the “ZONE” position on the two-speed heat pump control.
4. Outdoor Air Temperature Sensor must be attached in all dual fuel applications.
5. Dip switch No. 1 on Thermidistat should be set in OFF position for air conditioner installations. This is factory default.
6. Dip switch No. 1 on Thermidistat should be set in ON position for heat pump installations.
7. Dip switch No. 2 on Thermidistat should be set in OFF position for single-speed compressor operation. This is factory default.
8. Dip switch No. 2 on Thermidistat should be set in ON position for two-speed compressor operation.
9. Configuration Option No. 10 “Dual Fuel Selection” must be turned ON in all dual fuel applications.
10. NO connection should be made to the furnace HUM terminal when using a Thermidistat.
11. Optional connection. If wire is connected, dip switch No. 1 on furnace control should be set in ON position to allow Thermidistat/Thermostat to control furnace staging.
12. Optional connection. If wire is connected, ACRDJ jumper on furnace control should be removed to allow Thermidistat/Thermostat to control outdoor unit staging.
13. Furnace must control its own high-stage heating operation via furnace control algorithm. This is factory default.
14. The RVS Sensing terminal “L” should not be connected. This is internally used to sense defrost operation.
15. DO NOT SELECT the “FURNACE INTERFACE” or “BALANCE POINT” option on the two-speed heat pump control board. This is controlled internally by the Thermidistat/Dual Fuel Thermostat.
16. Dip switch D on Dual Fuel Thermostat should be set in OFF position for single-speed compressor operation. This is factory default.
17. Dip switch D on Dual Fuel Thermostat should be set in ON position for two-speed compressor operation.
CONTINUOUS BLOWER MODE

When the R to G circuit is closed by the thermostat, the blower motor BLWM will operate on continuous-blower speed (can be set to LO HT, HI HT, or COOL speed). Factory default is LO HT speed. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.

During a call for heat, the blower BLWM will stop during igniter warm-up (17 seconds), ignition (7 seconds), and blower-ON delay (66 seconds), allowing the furnace heat exchangers to heat up more quickly, then restarts at the end of the blower-ON delay period at LO HT or HI HT speed respectively.

In high-heat, the furnace control CPU will hold the blower motor BLWM at HI HT speed during the selected blower-OFF delay period before reverting to continuous-blower speed.

When the thermostat “calls for low-cooling”, the blower motor BLWM will switch to operate at low-cool speed (same speed as LO HT). When the thermostat is satisfied, the blower motor BLWM will operate an additional 90 seconds on low-cool speed before reverting back to continuous-blower speed.

When the thermostat “calls for high-cooling”, the blower motor BLWM will operate at COOL speed. When the thermostat is satisfied, the blower motor BLWM will operate an additional 90 seconds on COOL speed before reverting back to continuous-blower speed.

When the R to G circuit is opened, the blower motor BLWM will continue operating for an additional 5 seconds, if no other function requires blower motor BLWM operation.

Continuous Blower Speed Selection from Thermostat - To select different continuous-blower speeds from the room thermostat, momentarily turn off the FAN switch or push-button on the room thermostat for 1 - 3 seconds after the blower motor BLWM is operating. The furnace control CPU will shift the continuous- blower speed from the factory setting of LO HT to HI HT speed. Momentarily turning off the FAN switch again at the thermostat will shift the continuous-blower speed from HI HT to COOL. Repeating the procedure will switch the continuous-blower speed from COOL to LO HT speed. The selection can be changed as many times as desired and is stored in the memory to be automatically used following a power interruption.

HEAT PUMP

(See Fig. 52, 53, 54 and 55 for thermostat connections)

When installed with a heat pump, the furnace control CPU will hold the blower motor BLWM at HI HT speed during the selected blower-OFF delay period before reverting to continuous-blower speed.

When the thermostat “calls for low-cooling”, the blower motor BLWM will switch to operate at low-cool speed (same speed as LO HT). When the thermostat is satisfied, the blower motor BLWM will operate an additional 90 seconds on low-cool speed before reverting back to continuous-blower speed.

When the thermostat “calls for high-cooling”, the blower motor BLWM will operate at COOL speed. When the thermostat is satisfied, the blower motor BLWM will operate an additional 90 seconds on COOL speed before reverting back to continuous-blower speed.

When the R to G circuit is opened, the blower motor BLWM will continue operating for an additional 5 seconds, if no other function requires blower motor BLWM operation.

COMPONENT SELF-TEST

NOTE: The furnace control component test allows all components to run for a short time; except the gas valve and humidifier terminal HUM are not energized for safety reasons. The EAC-1 terminal is energized when blower is energized. This feature helps diagnose a system problem in case of a component failure. The component test feature will not operate if any thermostat signal is present at control and not until all time delays are completed.

To Begin Component Self-Test:

1. Remove blower access door.
2. Disconnect thermostat R lead from furnace control.
3. Manually close blower door switch.
4. For approximately 2 sec, short (jumper) the Com-24v terminal on control to the TEST/TWIN 3/16-in. quick-connect terminal on control until LED turns off. Remove jumper from terminals. (See Fig. 37.)

NOTE: If TEST/TWIN and Com-24v terminals are jumped longer than 2 sec, LED will flash rapidly and ignore component test request.

Component test sequence for 2-stage furnace is as follows:

a. LED will display previous status code 4 times.

b. Inducer motor starts on high-speed and continues to run until Step g of component test sequence.

c. Hot surface igniter is energized for 15 sec, then off.

d. Blower motor operates on LO-HT speed for 10 sec.

e. Blower motor operates on HI-HT speed for 10 sec.

f. Blower motor operates on COOL speed for 10 sec.

g. Inducer motor goes to low-speed for 10 sec, then stops.

5. Reconnect R lead to furnace control, remove tape from blower door switch, and re-install blower door.

6. Operate furnace per instruction on outer door.

7. Verify furnace shut down by lowering thermostat setting below room temperature.

8. Verify that furnace restarts by raising thermostat setting above room temperature.

OPERATE FURNACE

Follow procedures on operating instructions label attached to furnace.

FURNACE RESTART

With furnace operating, set thermostat below room temperature and observe that furnace goes off. Set thermostat above room temperature and observe that furnace restarts.
Step 5 - Adjustments

SET GAS INPUT RATE

Furnace gas input rate on rating plate is for installations at altitudes up to 2000 ft (609.6 M).

In the U.S.A., the input ratings for altitudes above 2000 ft (609.6 M) must be reduced by 2 percent for each 1000 ft (305 M) above sea level.

In Canada, the input ratings must be derated by 5 percent for altitudes of 2001 ft to 4500 ft (610 to 1372 M) above sea level. Adjust manifold pressure to obtain input rate.

Furnace input rate must be within ±2 percent of input on furnace rating plate adjusted for altitude.

1. Determine Natural Gas Orifice Size And Manifold Pressure For Correct Input.
   a. Obtain average gas heat value (at installed altitude) from local gas supplier.
   b. Obtain average gas specific gravity from local gas supplier.
   c. Verify furnace model and size. Table 15 can only be used for model 58MEC furnaces with heating inputs of 20,000/13,000 (High/Low) Btuh per burner.
   d. Find installation altitude in Table 15.

   NOTE: For Canada altitudes of 2001 to 4500 ft, (610 to 1372 M) use U.S.A. altitudes of 2001 to 3000 ft (610 to 914 M) in Table 12.

   e. Find closest natural gas heat value and specific gravity on Table 15.
   f. Follow heat value and specific gravity lines to point of intersection to find orifice size and manifold pressure settings for proper operation.

EXAMPLE:

(0 - 2000 ft (0 to 610 M) altitude using Table 15)
Heating value = 1050 Btu/cu ft
Specific gravity = 0.62
Therefore: Orifice No. 45
Manifold pressure 3.6-IN. WC for high heat
1.5-IN. WC for low heat
* Furnace is shipped with No. 45 orifices.
In this example all main burner orifices are the correct size and do not need to be changed to obtain the proper input rate.

g. Check and verify burner orifice size in furnace. NEVER ASSUME ORIFICE SIZE; ALWAYS CHECK AND VERIFY.

2. Adjust Manifold Pressure To Obtain Input Rate.
   a. Remove burner enclosure front.

   NOTE: Manifold pressure MUST always be measured with burner enclosure front REMOVED.

   b. Remove regulator seal caps that conceal adjustment screws for low-and high-heat gas valve pressure regulators. (See Fig. 58.)
   c. Move setup switch SW-1 on control center to ON position. This keeps furnace locked in low-heat operation.
   d. Jumper R and W/W1 thermostat connections on control to start furnace.
   e. Turn low-heat adjusting screw counterclockwise (out) to decrease input rate or clockwise (in) to increase rate.

   NOTE: DO NOT set low-heat manifold pressure less than 1.3-IN. WC or more than 1.7-IN. WC for natural gas. If manifold pressure is outside this range, change main burner orifices to obtain pressure in this range.

f. Move setup switch SW-1 to OFF position after completing low-heat adjustment.

g. Jumper R and W1 and W2 thermostat connections on control. (See Fig. 37.) This keeps furnace locked in high-heat operation.

   h. Turn high-heat adjusting screw counterclockwise (out) to decrease input rate or clockwise (in) to increase rate.

   NOTE: DO NOT set high-heat manifold pressure less than 3.2-IN. WC or more than 3.8-IN. WC for natural gas. If manifold pressure is outside this range, change main burner orifices to obtain pressure in this range.

   i. When correct input is obtained, replace caps that conceal gas valve regulator adjustment screws. Main burner flame should be clear blue, almost transparent. (See Fig. 59.)

   j. Remove jumper R-to-W1 and W2.

   NOTE: If orifice hole appears damaged or it is suspected to have been redrilled, check orifice hole with a numbered drill bit of correct size. Never redrill an orifice. A burr-free and squarely aligned orifice hole is essential for proper flame characteristics.

   f. Move setup switch SW-1 to OFF position after completing low-heat adjustment.

   g. Jumper R and W1 and W2 thermostat connections on control. (See Fig. 37.) This keeps furnace locked in high-heat operation.

   h. Turn high-heat adjusting screw counterclockwise (out) to decrease input rate or clockwise (in) to increase rate.

   NOTE: DO NOT set high-heat manifold pressure less than 3.2-IN. WC or more than 3.8-IN. WC for natural gas. If manifold pressure is outside this range, change main burner orifices to obtain pressure in this range.

   i. When correct input is obtained, replace caps that conceal gas valve regulator adjustment screws. Main burner flame should be clear blue, almost transparent. (See Fig. 59.)

   j. Remove jumper R-to-W1 and W2.

   NOTE: If orifice hole appears damaged or it is suspected to have been redrilled, check orifice hole with a numbered drill bit of correct size. Never redrill an orifice. A burr-free and squarely aligned orifice hole is essential for proper flame characteristics.

   f. Move setup switch SW-1 to OFF position after completing low-heat adjustment.

   g. Jumper R and W1 and W2 thermostat connections on control. (See Fig. 37.) This keeps furnace locked in high-heat operation.

   h. Turn high-heat adjusting screw counterclockwise (out) to decrease input rate or clockwise (in) to increase rate.

   NOTE: DO NOT set high-heat manifold pressure less than 3.2-IN. WC or more than 3.8-IN. WC for natural gas. If manifold pressure is outside this range, change main burner orifices to obtain pressure in this range.

   i. When correct input is obtained, replace caps that conceal gas valve regulator adjustment screws. Main burner flame should be clear blue, almost transparent. (See Fig. 59.)

   j. Remove jumper R-to-W1 and W2.

* Orifice numbers shown in BOLD are factory-installed.

NOTE: Percents of derate are based on midpoints of U.S. altitude ranges.
3. Verify Natural Gas Input Rate By Clocking Gas Meter.

**NOTE:** Be sure all pressure tubing, combustion-air and vent pipes, and burner enclosure front are in place when checking input by clocking gas meter.

a. Calculate high-altitude adjustment (if required).

**UNITED STATES**

At altitudes above 2000 ft (610 M), this furnace has been approved for 2 percent derate for each 1000 (505 M) ft above sea level. See Example and Table 15 for derate multiplier factor.

**EXAMPLE:**

<table>
<thead>
<tr>
<th>Furnace Input Rate</th>
<th>Derate Multiplier</th>
<th>Furnace Input Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>at Sea Level</td>
<td>Factor</td>
<td>at Installation</td>
</tr>
<tr>
<td>100,000</td>
<td>0.91</td>
<td>91,000</td>
</tr>
</tbody>
</table>

**CANADA**

At installation altitudes from 2001 to 4500 ft (610 to 1372 M), this furnace must be derated 5 percent by an authorized Gas Conversion Station or Dealer. To determine correct input rate for altitude, see example above and use 0.95 as derate multiplier factor.

b. Reinstall burner box cover.

**NOTE:** Clocking gas input rate MUST always be performed with the burner box cover INSTALLED.

c. Check that gas valve adjustment caps are in place for proper input to be clocked.

d. Obtain yearly heat value average for local gas supply.

**NOTE:** Be sure heating value of gas used for calculations is correct for your altitude. Consult local gas utility for altitude adjustment of gas heating value.

e. Check and verify orifice size in furnace. NEVER ASSUME THE ORIFICE SIZE. ALWAYS CHECK AND VERIFY.

f. Turn off all other gas appliances and pilots.

g. Move setup switch SW-1 to ON position. This keeps furnace locked in low-heat operation.

h. Jumper R-to-W/W1.

i. Let furnace run for 3 minutes in low-heat operation.

j. Measure time (in sec) for gas meter to complete 1 revolution. Note reading.

k. Refer to Table 17 for cubic ft of gas per hr.

l. Multiply gas rate cu ft/hr by heating value (Btu/cu ft).

m. Move setup switch SW-1 to OFF position and jumper R and W1 and W2 thermostat connections. This keeps furnace locked in high-heat operation. Repeat items ‘i' through ‘l' for high-heat operation.

**EXAMPLE:**

(0 - 2000 ft (610 M) altitude)

Furnace input from rating plate is 100,000 Btuh.

- Btu heating input = Btu/cu ft X cu ft/hr
- Heating value of gas = 975 Btu/cu ft
- Time for 1 revolution of 2-cu ft dial = 70 sec
- Gas rate = 103 cu ft/hr (from Table 17)
- Btu heating input = 103 X 975 = 100,425 Btuh. In this example, the orifice size and manifold pressure adjustment is within ±2 percent of the furnace input rate.

**NOTE:** Measured gas inputs (high-heat and low-heat) must be within ±2 percent of that stated on furnace rating plate when installed at sea level or derated per that stated above when installed at higher altitudes.

n. Remove jumper across R, W/W1, and W2 thermostat connections to terminate call for heat.

SET TEMPERATURE RISE

⚠️ CAUTION

UNIT DAMAGE HAZARD

Failure to follow this caution may result in unit component damage.

Temperature rise must be within limits specified on furnace rating plate. Recommended operation is at midpoint of rise range or slightly above.

Place SW-1 in ON position. Jumper R to W/W1 and W2 to check high-gas-heat temperature rise. To check low-gas-heat temperature rise, remove jumper to W2. Determine air temperature rise for both high and low gas heat. Do not exceed temperature range specified on unit rating plate for high and low gas heat.

This furnace must operate within the temperature rise range specified on the furnace rating plate. Determine the air temperature as follows:

a. Place duct thermometers in return and supply ducts as close to furnace as possible. Be sure thermometers do not “see” heat exchangers so that radiant heat does not affect thermometer readings. This is particularly important with straight run ducts.

b. When thermometer readings stabilize, subtract return-air temperature from supply-air temperature to determine temperature rise.

If the temperature rise is outside this range, check the following:

a. Gas input for low-and high gas heat operation.

b. Derate for altitude if applicable.

c. Return and supply ducts for excessive restrictions causing static pressures greater than 0.50-IN. WC.

d. Adjust temperature rise by adjusting blower speed. Increase blower speed to reduce temperature rise. Decrease blower speed to increase temperature rise.

⚠️ WARNING

ELECTRICAL SHOCK HAZARD

Failure to follow this warning could result in personal injury or death.

Disconnect 115-v electrical power before changing speed tap.

For low-heat, the following connections can be made at LO-HT on control:

a. Speed 2 (Orange)

b. Speed 1 (Red) - Factory Setting
UNIT DAMAGE HAZARD

To avoid operating outside the rise range and avoid component damage:
1. NEVER connect Speed Tap 1 (Red) wire to “HI HT.”
2. NEVER connect Speed Tap 2 (Orange) wire to “HI HT” on all models.

To change blower motor speed selections for heating mode, remove blower motor lead from control HI-HT terminal. (See Fig. 37.) Select desired blower motor speed lead from one of the other motor leads and relocate it to HI-HT terminal. (See Table 18 for lead color identification.) Reconnect original lead on SPARE terminal. Follow this same procedure for proper selection of LO-HT and COOL speed selection.

Set Blower Off Delay

- a. Remove Blower Access Door if installed.
- b. Turn Dip switch 2 and 3 ON or OFF for desired blower off delay. See Tables 13 and 14 or Fig. 36 and 37.

ADJUST BLOWER OFF DELAY (HEAT MODE)

If desired, the main blower off time delay period may be lengthened or shortened when operating in the heating mode to provide greater comfort. See Table 13 for position of switches and Fig. 36 or 37, for location of switches on control center.

SET THERMOSTAT HEAT ANTICIPATOR

When using a nonelectronic thermostat, the thermostat heat-anticipator must be set to match the amp draw of the electrical components in R-W/W1 circuit. Accurate amp draw readings can be obtained at thermostat subbase terminals R and W.

Fig. 61 illustrates an easy method of obtaining actual amp draw. The amp reading should be taken after blower motor has started and furnace is operating in low heat. To operate furnace in low-heat, first move SW-1 to ON position, then connect ammeter wires as shown in Fig. 61. The thermostat anticipator should NOT be in the circuit while measuring current. If thermostat has no subbase, the thermostat must be disconnected from R and W/W1 wires during current measurement Return SW-1 to final desired location after completing the reading.

See thermostat manufacturer’s instructions for adjusting heat anticipator and for varying heating cycle length.

When using an electronic thermostat, set cycle rate for 3 cycles per hour.

Step 6 - Check Safety Controls

This section covers the safety controls that must be checked before the installation is complete. The flame sensor, gas valve, and pressure switch were all checked in the Start-up procedure section as part of normal operation.

1. Check Primary Limit Control

This control shuts off gas control system and energizes air-circulating blower motor if furnace overheats. Recommended method of checking this limit control is to gradually block off return air after furnace has been operating for a period of at least 5 minutes. As soon as limit control has shut off burners, return-air opening should be unblocked to permit normal air circulation. By using this method to check limit control, it can be established that limit is functioning properly and operates if there is a restricted return-air supply or motor failure. If limit control does not function during this test, cause must be determined and corrected.
2. Check Pressure Switch
   This control proves operation of draft inducer. Check switch operation as follows:

   a. Turn off 115-v power to furnace.
   b. Remove outer furnace door and disconnect inducer motor lead wires from wire harness.
   c. Turn on 115-v power to furnace.
   d. Set thermostat to “call for heat” and wait 1 minute. When pressure switch is functioning properly, hot surface igniter should not glow, and status code LED flashes a Status Code 32. If hot surface igniter glows when inducer motor is disconnected, shut furnace down immediately. Determine reason pressure switch did not function properly and correct condition.
   e. Turn off 115-v power to furnace.
   f. Reconnect inducer motor leads, reinstall main furnace door, and turn on 115-v power supply.

   **CHECKLIST**
   1. Put away tools and instruments. Clean up debris.
   2. Check SW-1 through SW-3 after completing installation to ensure desired settings for thermostat type (SW-1) and blower-OFF delay (SW-2 and SW-3).
   3. Verify flame rollout manual reset switch has continuity.
   4. Verify that blower and outer doors are properly installed.
   5. Cycle test furnace with room thermostat.
   6. Check operation of accessories per manufacturer’s instructions.
   8. Leave literature packet near furnace.
