SAFETY CONSIDERATIONS

Read and follow manufacturer instructions carefully. Follow all local electrical codes during installation. All wiring must conform to local and national electrical codes. Improper wiring or installation may damage sensor.

Recognize safety information. This is the safety alert symbol. When the safety alert symbol is present on equipment or in the instruction manual, be alert to the potential for personal injury.

Understand the signal words DANGER, WARNING, and CAUTION. These words are used with the safety alert symbol. DANGER identifies the most serious hazards which will result in severe personal injury or death. WARNING signifies a hazard which could result in personal injury or death. CAUTION is used to identify unsafe practices which would result in minor personal injury or property damage.

GENERAL

The Outdoor-Rated Remote Temperature Sensor measures indoor or outdoor air temperature. The sensor measures temperature with a range of 0° to 160°F. If used indoors as a remote temperature sensor, the sensor will read room temperature and send the information to the thermostat. If used in conjunction with a residential thermostat, the sensor can be used to provide outside temperature information (which is not used to control heating or cooling).

INSTALLATION

Step 1 — Sensor Location
OUTDOOR LOCATION — The sensor should be mounted:
• on the north side of the building
• out of direct sunlight
• protected from rain and snow as best as possible

Good locations would be under an eave of a roof or under an overhang of a building.

INDOOR LOCATION — The sensor should be mounted:
• approximately 5 ft from the floor
• close to or in a frequently used room, preferably on an inside partitioning wall
• on a section of wall without pipes or ductwork
• where temperature operating limits are within 41 to 104°F
• where humidity operating range is within 0 to 95% relative humidity, non-condensing

The sensor should NOT be mounted:
• close to a window, on an outside wall, or next to a door leading to the outside
• where exposed to direct light and heat from a lamp, the sun, a fireplace, or any other temperature-radiating object which may cause a false reading
• close to or in direct airflow from supply registers or return air grilles
• in areas with poor air circulation (such as behind a door or in an alcove)

Step 2 — Sensor Installation
OUTDOOR WALL INSTALLATION — Cut a 1 x 2 1/2-in. mounting hole in the wall. Attach the mounting plate to the wall. If the Remote Temperature Sensor is mounted on a rough surface, it is recommended that a bead of silicon rubber be used around the entire edge of the mounting plate.

The sensor may also be installed on an electrical junction box. If mounting on an electrical junction box, be sure seal between junction box and sensor mounting plate is tight.

INDOOR INSTALLATION — Perform the following procedure to install the sensor:
1. Place the remote temperature sensor wall plate on the wall. Mark the mounting screw holes on the wall through the holes in the wall plate. See Fig. 1.
2. Drill two 3/16-in. mounting holes in the wall in the locations marked in Step 1.
3. Mount the remote temperature sensor wall plate to the wall with screws provided.

Step 3 — Wiring Requirements — The remote temperature sensor wiring has the following requirements:
1. All system wiring must be in compliance with all applicable local and national codes.
2. All sensor wiring should be color coded in conformance with standard recommendations.
3. All wiring should be 18-, 20-, or 22-gage, unshielded wire. The maximum distance between the sensor and the thermostat for 18-gage wire is 150 ft. The maximum distance between the sensor and the thermostat for 20-gage wire is 300 ft. The maximum distance between the sensor and the thermostat for 22-gage wire is 450 ft.

NOTE: Thinner wire is used for longer distances.

IMPORTANT: Do not use shielded wire. Do not run sensor wiring in the same conduit as the 24-v thermostat wiring. Electrical interference may cause the sensor to give incorrect temperature readings.
Step 4 — Sensor Wiring

![Sensor Wiring Diagram](image)

**WARNING**

Turn off power to thermostat before wiring. Death or injury from electric shock could result.

1. Connect wiring to sensor and thermostat wiring terminals. Be sure to follow color coding scheme. See Fig. 2. Connect RS GND terminal on remote temperature sensor circuit board to RS GND terminal on thermostat. Connect RS terminal on remote temperature sensor circuit board to RS1 terminal on thermostat. Connect RS+V terminal on remote temperature sensor circuit board to RS+5 terminal on thermostat. Do not run the sensor wiring in the same conduit as the 24-v thermostat wiring.

2. Install the remote temperature sensor top case onto the wall plate using the screws provided.

**Step 5 — Configure the Thermostat** — Depending on the type of thermostat, the thermostat may need to be configured for use with the remote temperature sensor.

Some thermostats will automatically detect the sensor wired to the thermostat terminal block and use the temperature sensor output. Other thermostats may need to be configured for use with a remote temperature sensor. Refer to the Advanced Setup section in the thermostat installation instructions for thermostat configuration information.
